H145 (BK-117 D2) Helicopters
Base Pack & Action Pack
Version 2.0 (Build .483)
(Last Updated: 2024/04/06)

THIS SOFTWARE IS PROVIDED "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE COPYRIGHT HOLDER OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THE SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This simulation software is not supported or endorsed by Airbus SE or Airbus Helicopters. All trademarks and brand names are registered trademarks of the respective owners.

This product is compatible only with Microsoft Flight Simulator 2020

Our H145 helicopter has been rebuilt as a native helicopter. We now leverage the Asobo CFD helicopter flight model, however we also augment the flight controls to realistically simulate the H145 systems. Our helicopter includes unstabilized flight, stabilized flight (by Stability Augmentation System) and fully hands-off Upper Modes, like HDG/ALT/IAS. H145 also supports GPS-referenced modes and the ability to command a precision hands-off auto hover. H145 supports Force Trim (Trim Release) which you won't find in other MSFS helicopters. We also integrate a Garmin GTN750 which enables GPS approaches and much more.

We use an installer/update program called **Hype Operations Center** to manage installation of our products. You will find easy installation, quick updates, downgrades and rollback to earlier versions as you prefer.

H145 has over 600 key bindings which are available for you to bind using Hype Operations Center. You can also directly send events and monitor local variables using programs like SPAD.next or FSUIPC.

This manual is not part of the official documentation of the Hype Performance Group. It consists of:

- Included PDF-Dokumentation (see \Community\hpg-airbus-h145\H145 User Guide.pdf)
- [H145 Userguide \(Internet\)](#)
- [Hype Operation Center \(Internet\)](#)
- [Mission System \(Internet\)](#)

With thanks to Dave and the development team for their excellent product, have fun
D-VRGL, Leo Schoonboodt

Getting Started

Installation

Complete all three steps:

- 1. [Download & Install H145](#)
- 2. Configure [Controls & Bindings](#)
- 3. Learn about [Aircraft Settings](#)

Flying Basics

H145 is similar to something like a mix of an airliner and a traditional helicopter.

Before flight, the pilot should turn on **A.TRIM** , **AP1** , **AP2** and **BKUP** (These are all on the Autopilot control panel or APCP, which is on the center console below the GTN750).

The pilot shall hold **Cyclic Trim Release** before raising the collective for takeoff. The pilot will lift off from the ground and only once in a hover may the trim be released. Once the trim is released, the aircraft AFCS will continually attempt to maintain the current attitude where the pilot last let go of trim release.

The autopilot has more than just attitude stabilization (which is the normal mode, and not visualized on the MFD), there are also so-called **UPPER MODES** . These upper modes are traditional flight control modes like HDG (heading hold), ALT (altitude hold), but also ground-based GPS modes likes GTC. You can use the tablet autopilot panel (click the clock at the top of the tablet) to learn more about the modes and to issue commands without setting up buttons on your controller.

Remember, you need to heed the limits on the FLI (the vertical tape to the left side of your pilot MFD). Take-off power (yellow) is allowed for 30 minutes per flight. Once you exceed and go "into the red", the engines won't be able to keep up and your rotor rpm will slow. If the rotor rpm slows below 80%, you will fall out of the sky.

Next you can learn more about the [AFCS](#) and other [Aircraft Systems](#) and [Procedures \(Checklists\)](#).

Notable Changes since Version 1.0

- The new native flight model is more challenging and also authentic in both AFCS OFF and AFCS ON modes.
- You may use the **MSFS Piloting Assistance: Tail Rotor** setting to neutralize rotor torque and simplify flying (for twist grip controllers and gamepads), but do not use the **MSFS Piloting Assistance: Cyclic Assist** in MSFS as it will not work with H145. This replaces the Arcade flight model.
- Stability Level is configurable for your controller, for each axis.
- **Trim Release (CYCLIC TRIM RELEASE)** is required now. It exists as the same control in 1.0, however it is necessary to use it now, even when follow-up trim is available.
- **A.TRIM OFF** requires Trim Release, if you preferred this mode, change to the Latching Trim Release bindings.
- New settings are available on the tablet.
- AirlandFS support is deprecated.

Information for Livery Authors

- Paint Kit
- Configure external hardware JSON
- texture.cfg for each variant

See [Livery Author Info](#)

Controls & Bindings

Control bindings are now available in either the previous fixed-wing bindings or the new (SU11 and later) native helicopter bindings. You can use either version, but do not use both at once for the same axis as this will result in loss of control.

Primary Flight Controls

Function	MSFS Axis Bindings
Collective	THROTTLE AXIS or COLLECTIVE AXIS
Cyclic Pitch	CYCLIC LONGITUDINAL AXIS
Cyclic Roll	AILERONS AXIS or CYCLIC LATERAL AXIS
Yaw Pedals	RUDDER AXIS or TAIL ROTOR AXIS *

* You may also use the split-rudder axis (RUDDER AXIS LEFT and RUDDER AXIS RIGHT)
Button inputs are also available on all axis.

Beep Trim

Function	MSFS Axis Bindings
Cyclic Pitch	INCREASE ROTOR LONGITUDINAL TRIM and DECREASE ROTOR LONGITUDINAL TRIM
Cyclic Roll	INCREASE ROTOR LONGITUDINAL TRIM and DECREASE ROTOR LONGITUDINAL TRIM
Collective	INCREASE AUTOPILOT N1 REFERENCE and DECREASE AUTOPILOT N1 REFERENCE
Yaw Pedals *	RUDDER TRIM LEFT and RUDDER TRIM RIGHT

* - Yaw trim is known as Collective Left/Right beep trim.

Other Important Bindings

Function	MSFS Binding	Notes
Cyclic Trim Release	ROTOR TRIM RESET	Hold down anytime you manipulate the cyclic with the AFCS. There are also latching bindings available to avoid holding it.
AP/BKUP ON	AUTOPILOT ON	Press once to engage BKUP/AP1/AP2, press again to engage ALT/HDG/IAS.
AP/UM OFF	AUTOPILOT OFF	Press once to cancel upper modes. Hold for 2 seconds to clear all bugs
AP/BKUP CUT	TOGGLE DISENGAGE AUTOPILOT	Press once to disengage AP1/AP2. Press again to disengage BKUP.
AP/GTC	TOGGLE AUTO HOVER	Press once for GTC. Press twice for GTC.H
RESET (message list)	ANNUNCIATOR SWITCH OFF	Clear message list on FND page
OEI HI/LO	ARM AUTO THROTTLE	Toggle between OEI HIGH and OEI LOW rating
Go Around	AUTO THROTTLE TO GA	Activate Go-Around mode
Bambi Bucket Dump Cargo Attach/Detach Fire Weapons	TOGGLE YAW DAMPER	

Take care to use the **On Release** logic in MSFS bindings, to avoid key repeating. This does not apply to Trim Release as it is configured to be held with repeating.

Continue with the 1.0 documentation for more information on bindings, or proceed to Hype Operations Center to bind others.

Custom Control Bindings

Add custom control bindings through Hype Operations Center.

1. Open [Hype Operations Center](#) (You must have version 1.0.31 or higher for language selection)
2. Select your language under [Settings](#) (this ensures you see localized text which will be the same as you see later in MSFS)
3. Visit the H145 page, then click [View/Modify Key Bindings](#)

4. Scroll to the bottom and click **Add Binding** to define a new control binding
5. Pick a MSFS event (nearly at random) on the left side. You can start with **SET ADF VOLUME**
6. Pick the H145 function on the right side (You may test this in the cockpit using the Event Tester tablet app)
7. Click Save.
8. If MSFS is already running, you must now **restart the flight** (not the full simulator).
9. In MSFS, select the binding you picked in step 5, and the button on your controller.

You're done. Pressing the button should now activate the H145 function. You can repeat this process to create as many custom bindings as needed.

* - MSFS **HELD** events are likely to have incorrect/odd behavior with repeating. * - Using the 'On Release' logic in MSFS often avoids incorrect key repeating which could break the ability to use a toggle-style button.

Trim Release

Trim Release (Cyclic Trim Release) is a button on the cyclic control which the pilot holds anytime they are manipulating the cyclic. This is a very important aspect of H145 and doing so both pauses the AFCS (so it doesn't fight you) and also gives you maximum precision (no deadzone).

There are multiple bindings you can choose from, the HOLD version (which you hold continually) or the LATCH version (which you simply click), which you may assign to a switch or other logic. There is no indication on the MFD when trim is released.

If you fail to use trim release, you will fight the autoflight systems!

Note: In previous H145 versions, **A.TRIM OFF** could be used similarly, however now you must move to the latching bindings (see below).

Binding	Notes
Cyclic Control - Trim Release (HOLD)	Recommended. This button will keep the trim release open until released, allowing for precise manual flight
Cyclic Control - Trim Release (Latch: Open)	This will set trim release to the open (pushed by pilot) state
Cyclic Control - Trim Release (Latch: Closed)	This will restore trim release to the closed (not pushed) state
Cyclic Control - Trim Release (Latch: Toggle)	Clicking this button will toggle the trim release state

There is also a lesser-used **Collective Trim Release**. This command is only needed when the AFCS has a collective mode engaged (like ALT, VS, CR.HT, V.APP etc.). Often it is easier to simply issue **AP/UM OFF** and cancel the mode instead.

Binding	Notes
Collective Control - Trim Release (HOLD)	Recommended. This button will keep the trim release open until released, enabling override of modes engaged on the collective axis
Collective Control - Trim Release (Latch: Open)	This will set trim release to the open (pushed by pilot) state
Collective Control - Trim Release (Latch: Closed)	This will restore trim release to the closed (not pushed) state
Collective Control - Trim Release (Latch: Toggle)	Clicking this button will toggle the trim release state

Example Control Profile

	H145 Function	Notes
1	AP/GTC	Press once: Engage GTC mode (ground-speed hold), Press twice: Engage GTC.H mode (auto hover)
2	UP: AP/BKUP ON, DOWN: AP/UM OFF	Engage Autopilot, Disengage Upper Modes
3	AP/BKUP CUT	Press once: Disengage AP1 and AP2 system Press twice: Disengage Backup SAS
4	CYCLIC TRIM RELEASE	Press and hold whenever making manual aircraft inputs.
5	RESET	Acknowledge any new messages in the Message List.
6	CYCLIC BEEP TRIM (UP, LEFT, DOWN, RIGHT)	4-way cyclic beep trim. Issue inputs in the respective axis (up and down is pitch, left and right is roll) in AFCS modes and manual trim with the AFCS off.
7	COLLECTIVE BEEP TRIM (LEFT, RIGHT)	4-way collective beep trim. Issue inputs in the respective axis (up and down is collective, left and right is yaw)
8	COLLECTIVE BEEP TRIM	(UP) See above.
9	COLLECTIVE BEEP TRIM	(DOWN) See Above.

Settings for Xbox controller

The default Xbox controller profile will work with H145.

These settings will better accommodate the small throw of the Xbox controller joystick:

H145 Tablet:

- **Gameplay Mode** : Arcade
- **Cyclic Control** : Centering-Springs
- **Cyclic SAS Stability Level** : 100
- **Follow-Up Trim** : Both
- **Tail Rotor SAS Stability Level** : 100
- **Collective SAS Stability Level** : 100
- **Collective Step Size (Keyboard)** : Large
- **Pedal trim system**: Software (default)
- **FEED On detection strategy**: Deadzone (default)

MSFS Piloting Assistance:

- **Tail Rotor** : ON
- **Cyclic** : OFF

Recommended MSFS Settings

General Options – Camera

CAMERA SHAKE: OFF

Camera Shake causes some problems with the helicopter flight models.

General Options – Data

ONLINE FUNCTIONALITY: ON

Online functionality is required for H145 to activate, as well as for a number of H145 features like online maps and weather.

Assistance Options - Piloting

- AUTO-RUDDER: OFF
- ASSISTED YOKE: OFF
- ASSISTED LANDING: OFF
- ASSISTED TAKEOFF: OFF
- AI ANTI-STALL PROTECTION: OFF
- AI AUTO-TRIM: OFF
- ASSISTED CONTROLLER SENSITIVITY: OFF

Fixed-wing pilot assistance settings cause control problems for helicopter flight models. Unexpected behaviors are very often caused by these settings and it is very important that they are disabled.

MSFS Cockpit Interaction System

Microsoft Flight Simulator has two modes of operating interactive elements within the virtual cockpit. These modes are controlled by the Cockpit Interaction System setting, under the Accessibility category of General Options. You may be using either setting depending on when you first installed the game.

Lock: Xbox-preferred interaction method, new in Sim Update 5. This is the default setting for new players. This mode uses a blue and yellow visual highlight on most (but not all) interactive elements.
Legacy: Classic input method used by FSX and Prepar3D. Moving the mouse over an interactive element will show a cursor but will not change their visual appearance of that element.

Operating knobs with a center push function

Lock:

1. Target a knob and press-and-hold Left mouse button
2. Click the Right mouse button
3. Release the Left mouse button

Legacy:

1. Target the center of the knob (not the left/right or top/bottom sides)
2. Click the Left mouse button

H145 in Multiplayer

Seeing other helicopters

In order to see another H145 in MSFS multiplayer you will need to ensure that both players:

1. Have the same aircraft installed
2. Have the same livery installed
3. Configured the MSFS setting Use Generic Plane Models to OFF

If these three conditions are not met, you will see a hovering fixed-wing plane in place of a player who is actually flying a helicopter

Limitations

Without helicopter support in MSFS the H145 has many custom systems and implementations which are not normal for other aircraft.

The lack of door and helicopter variables means that you will see other players showing the same as your aircraft configuration. This includes doors, the rotor spinning state, WSPS, radome and other external part configurations. Later we may be able to remove these restrictions.

Weapons in multiplayer

Other players will not see your H145M weapon launches, they exist only in your local simulator. Weapons will also not be able to shoot down AI or multiplayer aircraft at this time.

Aircraft Settings

Aircraft settings are generally controlled on the H145 tablet, inside the Aircraft app.

H145 Tablet Setup

Settings have changed starting in Build 450. Skip to the section below.

The tablet has a new set of settings for the native flight model. Open the tablet -> **Aircraft** (app) -> Setup (page).

Setting	Description
Aircraft Damage On or Off	This setting controls the built-in damage model which impacts the aircraft engines, systems and flight model.
Gameplay Mode Realistic or Arcade	The Arcade mode will not allow over-torque on the collective, the FLI limit will be automatic.
Vortex Ring State On or Off	The On mode will enable a realistic VRS simulation which will cause loss of rotor lift.

Cyclic Control Settings

Setting	Description
Cyclic Control No-Springs or Centering-Springs	The Centering-Springs setting is intended for joysticks with a centering spring. The aircraft trim position will be approximated so the joystick is always centered to maintain the current flight condition. The No-Springs setting requires you to deflect the cyclic as the aircraft moves into cruise, or you may take advantage of the center-displacement binding.
SAS Stability Level -100 to +100	This slider controls the relative stability of the SAS. If you have a full cyclic with a long extension, you may prefer values at approximately -75. If you have a joystick, the default value of 0, and for game controllers a value of +100 may be preferred. This setting is mainly to compensate for different controllers. Avoid settings lower than -80 as they are unrealistically destabilized.
Deadzone 1 to 100	This slider controls the size of the deadzone which is used to determine HANDS ON detection. This setting should be as low as possible such that when releasing the controller, HANDS ON is reliably not displayed.
Follow-Up Trim Off Only Hover Only Cruise Both	Follow-Up trim will enable you to avoid using trim release for some cyclic manipulations. Hover domain is defined as less than 30 knots airspeed. Trim Release is preferred to depending on follow-up trim.
AFCS Override Dual Input Autopilot only	Changing to Autopilot only will prevent any input from the cyclic when in ATT mode or any upper mode. This setting is intended for users that lack a friction lock and also lack a spring on their cyclic. This setting allows use of the AFCS by using beep trim and Trim Release.
Center Displace Reset Time	This setting applies only to H:H145_SDK_CYCLIC_FORCE_TRIM_DISPLACE_CENTER Cyclic Control - Displace Cyclic Center (Force Trim) and controls how long to wait before reconnecting the user flight controls.

Tail Rotor Control Settings

Setting	Description
Tail Rotor Control Centering-Springs or Legacy	The Centering-Springs setting is designed for pedals with and without springs, and enables yaw stabilized when in hover The Legacy setting has free yaw pedals, which is not as realistic.

SAS Stability Level -100 to +100	This slider controls the relative stability of the yaw SAS. It will be easier to hold a heading in hover with a higher value. This setting is mainly to compensate for different controllers. Avoid settings lower than -80 as they are unrealistically destabilized.
Deadzone 1 to 100	This slider controls the size of the deadzone which is used to determine FEET ON detection. This setting should be as low as possible such that when releasing the controller, FEET ON is reliably not displayed.

Collective Control Settings

Setting	Description
SAS Stability Level -100 to +100	This slider controls the relative stability of the collective SAS. It will be easier to hold height over the ground in hover with a higher value. This setting is mainly to compensate for different controllers. Avoid settings lower than -80 as they are unrealistically destabilized.
Step Size (Keyboard)	This setting applies only to button/keyboard collective inputs. It will control how large the response of the collective for each button press.

Setup (V2)

The below settings apply starting with build 450.

Cyclic Sensitivity

This setting is essentially the same as the MSFS Controls Sensitivity setting

HANDS ON detection

This setting controls the HANDS ON detection strategy. The slider below corresponds to the threshold relative to the selected strategy.

Strategy	Description
None	Used for Force-Feedback controllers. In this mode there is no HANDS ON detection unless <code>L : FFB_HANDS_ON_CYCLIC=1</code> .
Motion Rate	Used for any controller. Detection is based on rate of motion. The slider will adjust the relative motion rate which triggers detection.
Deadzone	Used for any controller. Detection is based on the deflection of the stick exceeding a specific threshold, which is set by the slider below.
Ignore	Used for controllers without sufficient ability to hold a position. In this mode the cyclic is completely ignored when using AFCS upper modes.

Pedals Sensitivity

This setting is essentially the same as the MSFS Controls Sensitivity setting.

FEET ON detection

This setting controls the FEET ON detection strategy. The slider below corresponds to the threshold relative to the selected strategy.

Strategy	Description
None	Used for Force-Feedback controllers. In this mode there is no FEET ON detection unless L:FFB_FEET_ON_PEDALS=1.
Motion Rate	Used for any controller. Detection is based on rate of motion. The slider will adjust the relative motion rate which triggers detection.
Deadzone	Used for any controller. Detection is based on the deflection of the stick exceeding a specific threshold, which is set by the slider below.

Cyclic Trim System

This setting controls whether there is a virtual trim (good for controllers with springs) or a hardware trim (good for Force-feedback controllers).

Strategy	Description
Software	The virtual trim point is visible on the VMS CTRL page as a blue cursor. It will move slowly to follow the stick and relax any forces.
Hardware	The virtual trim is disabled, Force-Feedback controllers are likely in use.

Pedals Trim System

This setting controls whether there is a virtual trim (good for controllers with springs) or a hardware trim (good for Force-feedback controllers).

Strategy	Description
Software	The virtual trim point is visible on the VMS CTRL page as a blue cursor. It will move slowly to follow the pedals and relax any forces.
Hardware	The virtual trim is disabled, Force-Feedback controllers are likely in use.

Pedals ATT Mode

This setting is provided for compatibility with previous usage.

Strategy	Description
Normal	ATT mode will stabilize and hold heading in hover.
Legacy	ATT mode will not stabilize and hold heading in hover.

Gameplay Mode

This setting provides an easier flight model for users with less comprehensive hardware.

Strategy	Description
Realistic	Realistic SAS implementation.
Arcade	Heavy-handed SAS implementation.

Aircraft Damage

This setting configures the wear and damage model for the aircraft.

Strategy	Description
Off	No damage. Check that your MSFS damage is also turned off.
On	Engine damage, IBF clogging.

Vortex Ring State

This setting configures the VRS model on top of the MSFS flight dynamics. VRS is a dangerous condition where lift is lost.

Strategy	Description
Off	VRS model is not active.
On	VRS is active, avoid descent below 500fpm when below 20kias.

Cyclic Follow-Up Trim

This setting configures the Follow-Up Trim behavior.

Strategy	Description
Off	Trim Release must be used to update AFCS attitude setpoints.
Hover	Hands On detection in hover domain will result in updating AFCS attitude setpoints.
Cruise	Hands On detection in cruise domain will result in updating AFCS attitude setpoints.
Both	Hands On detection in both hover and cruise domain will result in updating AFCS attitude setpoints.

Cyclic Displace Center-Reset-Time

This setting configures how long the cyclic is disabled after the Displace-Center binding function is used.

Collective Inc/Dec Step Size

This setting configures how much collective is added or remove when clicking increment/decrement buttons. This does not apply when using an axis binding.

View Documentation

Opens a Web-Browser and load the H145-Handbook. Be carefull if in VR.

Restore page to default

Resets the settings to default values.

Cold & Dark

This switch puts the airplane in a switched-off state. It is used, for example, when taking off from a heliport or runway as all systems are always automatically started up here.

Ready for Takeoff

This switch makes the aircraft ready for take-off when the button is pressed.

Checklists

General Limitations

The H145 shall be operated in compliance with the limitations in this section. This helicopter is approved for flight under VFR and IFR flight rules in addition to overwater operation.

The following are prohibited:

- Aerobatic maneuvers
- Flight into icing conditions. Should icing conditions be encountered unexpectedly, the conditions shall be left immediately

Limitation	
Maximum speed for starting and stopping the rotor	50kt
Maximum relative wind speed from any direction (except headwind)	30kt
Sloped landing limitation	Sloping nose down: 10° Sloping up to the right: 12° Sloping up to the left: 8° Sloping nose up: 8°
Maximum operating altitude	20,000FT PA
Maximum operating altitude for takeoff, hover and landing	20,000FT PA or DA (whichever is less)
Maximum air temperature Minimum air temperature Or with cold weather kit: Maximum air temperature Minimum air temperature	ISA +35C (max +50C) -30C +35C -45C
Ground operations duration when > 40C OAT	Ground operations limited to 20 minutes NOTE: When >35C OAT, lower cockpit temp by using max ventilation
Maximum gross mass for flight Minimum gross mass for flight	3700kg 2000kg
V[NE]	150kt or less (see Airspeed indicator)

Torque limitations

	AEO Limitation	Torque
1	Max continuous power (no limit)	2x74%
2	Take-off power (30mins)	2x95% below Vy+5
3	Transient limit (unintended use)	2x104.5 below Vy+5

Above Vy+5kt, take-off power will gradually disappear. The limits on the engine indications and the FLI will move according to the chart:

	OEI Limitation	Torque
1	Max continuous power (no limit)	1x100%
2	2-minute power	1x143%
3	30-second power	1x150%

TOT limitations

	Starting Limitation	TOT
1	Continuous starting	840C
2	Transient starting (max 10 seconds)	960C

	AEO Limitation	TOT
1	Max continuous	901C
2	Take-off power (max 30 minutes)	918C
3	Transient limit (unintended use)	945C

	OEI Limitation	TOT
1	Max continuous	945C
2	2-minute power	987C
3	30-second power	1006C

N1 limitations

	AEO Limitation	N1
1	Max continuous	98.5%
2	Take-off power (max 30 minutes)	100.6%
3	Transient limit (unintended use)	101.7%

	OEI Limitation	N1
1	Max continuous	101.7%
2	2-minute power	104.3%
3	30-second power	105.7%

Procedures

Procedures below are realistic, adapted from the BK-117 D2 (H145) flight manual and simplified where necessary. Execute each step starting at the top left, monitoring items on the right, and ending by doing cleanup tasks on the bottom left.

Procedure	Purpose	Notes
Cockpit safety inspection	Confirm cockpit switches are in a safe position before bringing power to the aircraft.	Not included, Cold & Dark startup at a gate has already completed these steps for you.
Power-Up Procedure	Bring electrical power to the aircraft and prepare to start engines.	
Engine Start Procedure	Start the first and then second engine	
Hydraulic check procedure	Verify that both SYSTEM 1 and SYSTEM 2 are functional	To be completed on the first flight of the day
After Engine Start Procedure	Prepare the aircraft for flight after engine start	
Pre-Flight Procedure	Verify the AFCS before flight.	
After Takeoff Procedure	Verification of takeoff steps and preparation to conduct a safe flight.	
After Landing Procedure	Reduce engines to idle and prepare to stop the rotor and shutdown the aircraft	
Engine Shutdown Procedure	Shutdown the engines and remove power from the aircraft.	

Power-Up Procedures

BAT MSTR switch to ON , then ENGAGE	Allow 20 seconds for system startup – PWR-UP TST OK
TEST FIRE 1 switch to EXT	– FIRE BOT1+BOT2 USED Audio tone
TEST FIRE 1 switch to EXT+WARN	On Message List: – ENG1 FIRE – FIRE BOT1+BOT2 TEST On Warning Unit: FIRE EXT BOT1 BOT2
TEST FIRE 1 switch to OFF	Audio tone + FIRE - ENGINE 1 FIRE
Repeat fire test for 2	LOW FUEL1 BAT OVHT ENG1 FAIL ROTOR RPM ENG2 FAIL MGB OIL P LOW FUEL2 CARGO SMOKE AP Audio Test – TRAIN (Engine CP) – APCP: all lights on – EXIT lights illuminate
TEST switch to OFF	
TEST switch to LAMP	
VMS page, press NUM	Check Battery Voltage > 23.5
VMS page, WEIGHT subformat	Adjust Crew, Payload, and Fuel as required. Use the PUSH knob to advance the line
VMS page, press PREV	
FND page	On Message List: – ENG 1 FAIL ENG2 – AFT+FWD FUEL PMP – PITOT1 HEATER OFF PITOT2 – PWR-UP TST OK
Flight instruments, IESI	Wait for alignment, set baro as required
EXT LIGHTS ACOL	Set as required

Engine Start Procedure

FUEL PRIME PUMP 1 switch to ON FUEL PRIME PUMP 2 switch to ON	– FUEL 1 PRIME PUMP ON FUEL 2
ENG 1 MAIN switch to IDLE	N1: Monitor, increasing TOT, N2, NR: Monitor, increasing MGB oil pressure: increasing Hydraulic pressure: increasing – START-UP TEST At 60% N1, STARTER extinguishes. At 78% N1, IDLE appears.
Repeat for second engine	– START-UP TEST OK

Hydraulic Check Procedure

TEST HYD switch to SYS1	– LOW PRESS HYD2 Check VMS page HYD2 pressure low caution Check cyclic/collective/pedals normal forces
TEST HYD switch to SYS2	– HYD1 LOW PRESS – HYD1 TR SHUT OFF
TEST HYD switch to OFF	Check VMS page HYD1 pressure low caution Check cyclic/collective/pedals normal forces

After Engine Start Procedure

PT/STATIC HTG PILOT switch to ON PT/STATIC HTG COPILOT switch to ON AVIO MSTR 1 switch to ON AVIO MSTR 2 switch to ON STBY BAT switch to ON LAVCS switch to PIL	
FUEL PRIME PUMP 1 switch to OFF FUEL PRIME PUMP 2 switch to OFF FUEL XFER PUMP F switch to ON FUEL XFER PUMP A switch to ON	
EXT LIGHTS POS and STROBE	As required
INT LIGHTS EM/EX switch to ARM	
Cockpit/Pax Ventilation	As required

Pre-Flight Procedure

Collective lever to FULL DOWN TEST switch to LAMP	
TEST switch to PRE-FLIGHT TEST switch to OFF	– P-FLT TEST Wait for the test to complete – P-FLT TEST OK
AP/BKUP ON - UP button PRESS	FND AFCS Status Strip:  (boxes will disappear after a few seconds)
AP/BKUP CUT button PRESS	SAS SAS AFCS DISENGAGED
AP/BKUP CUT button PRESS AP/BKUP ON - UP button PRESS	SAS SAS AFCS DISENGAGED
BEEP TRIM	Check all 4 directions
FIXED LANDING and S/L LIGHTS	As required
EMER FLOATS	As required
ENG 1+2 MAIN switch to FLIGHT (and latch)	

After Takeoff Procedure

Perform Hover Flight	N2, NR > 101% FLI: AEO Indication No warnings on message list
----------------------	---

Before Landing Procedure

Fixed LANDING and S/L Lights	As required
FND & VMS pages	No messages on master list ENG 1 & ENG 2 N2 > 101% NR > 101%
DH (Decision Height)	As required

Engine Shutdown Procedure

Cyclic to neutral position Collective to FULL DOWN ENG 1 MAIN switch to IDLE ENG 2 MAIN switch to IDLE	Wait 30 seconds for engine cool down
FUEL XFER PUMP F switch to OFF FUEL XFER PUMP A switch to OFF PT/STATIC HTG PILOT switch to OFF PT/STATIC HTG COPILOT switch to OFF AVIO MSTR 1 switch to OFF AVIO MSTR 2 switch to OFF STBY BAT switch to OFF LANDING LIGHT switch to OFF S/L LIGHT switch to OFF Other electrical consumers to OFF	Check electrical load on VMS page
ENG 1 MAIN switch to OFF ENG 2 MAIN switch to OFF	– ENG 1 FAIL ENG2 TOT: Monitor decrease N1: Monitor decrease Wait for rotor to stop
EXT LIGHTS ACOL switch to OFF	Check VMS FLIGHT REPORT – DOWNLOAD IN PROGRESS Download takes approx. 1 minute – DOWNLOAD COMPLETE
BAT MSTR switch to OFF	

Abnormal Procedures (Checklists)**This Section Is Unfinished**

Procedure	Condition	Notes
Warning Indications: FIRE	Engine fire or overtemperature in the engine compartment	

Warning Indications: FIRE

Conditions: Overtemperature in engine compartment	On Warning Unit: FIRE and Audio tone or On Message List: – ENG1 FIRE and voice message FIRE - ENGINE 1 FIRE
FIRE on Warning Unit PRESS	On Warning Unit: ACTIVE BOT1
BOT1 on Warning Unit PRESS	After 15 seconds bottle 2 will become active. On Warning Unit: BOT2 After 1 minute if the fire is not extinguished, proceed to discharge bottle 2.
BOT2 on Warning Unit PRESS	
	On Message List: FIRE BOT1+BOT2 USED

Systems

Cockpit Arrangement

1. Warning Unit
2. Co-pilot MFD (MFD1)
3. Standby instruments (IESI)
4. Center MFD (MFD4)
5. Pilot MFD (MFD2)
6. Tablet Hinge
7. Engine control panel (ECP)
8. Co-pilot GTN750
9. Pilot GTN750
10. Co-pilot control panel (CCP)
11. Auto-pilot control panel (APCP)
12. Weather Radar control panel (WXRCP)
13. TFM-138B Radio
14. Ground Power control panel (GPCP)
15. Cabin air control panel
16. Data transfer device

Master Warning Unit

The Warning Unit panel displays critical conditions which require immediate pilot action. The Engine shutoff and fire extinguishing controls are also integrated into the panel.

ACTIVE	Emergency Fuel Shut-Off valve is ACTIVE
LOW FUEL 1/2	Fuel in respective supply tank is below 40%
ENG 1/2 FAIL	Engine failure
ROTOR RPM	Rotor RPM is above 109% or below 97%
BAT OVHT	Battery OverheatMain battery over 50C
MGB OIL P	Main Gearbox oil pressure out of limits
AP	Autopilot failure
CARGO SMOKE	Smoke is detected in cargo compartment

EXT	Fire extinguishing system is active (due to emergency fuel shutoff being activated)
BOT1 BOT2	Press to discharge the respective fire bottle. (Bottles 1 and 2 are shared between both engines, and available to discharge on either side)
FIRE	FIRE indication (engine fire is detected) FIRE push button (lift guard first) activates the Emergency Fuel Shutoff for the respective engine. See the engine fire procedures further in this document

Engine Control Panel

The Engine Control Panel (ECP) is used to start and stop the engines as well as operate additional functions for emergency or abnormal procedures. The Training button between the engines is a function used to simulate One-Engine-Inoperative flight condition.

1. Engine 1 Main switch (with latch)
2. Engine 1 Ventilation Button (inoperative)
3. Engine 1 FADEC Emergency switch (with guard)
4. OEI Training mode (inoperative)

The **Engine Main** switch may be placed into 3 detents: OFF, IDLE and FLIGHT. The IDLE detent is used for starting the engine and for cooldown after flight, it will not raise the rotor RPM to 100%. The FLIGHT detent is to be selected prior to takeoff and until after landing. The OFF detent will close the fuel valve and trigger an engine shutdown. When in the FLIGHT position, the engine main switches should be latched.

The **FADEC EMER** switch is to be used in case of the **FADEC FAIL** indication on the message list. When the FADEC EMER switch is placed to ON it will activate a backup mode which will meter the fuel valve of the engine of the failed side to match the TOT of the working side.

NOTE: FADEC EMER will reduce the rate at which N1 changes. Expect this and avoid large power demand changes.

The **Engine Ventilation** button (**inoperative**) is to be used when directed after a failed engine start. The starter motor will run without opening the fuel valve in order to clear the engine for possible restart.

The **Training** button (**inoperative**) simulates One-Engine-Inoperative (OEI) flight condition while retaining the safety margin of the working engine. (For simulation use you may safely take one engine to the IDLE position for a similar effect)

Autopilot Control Panel

The Autopilot Control Panel (APCP) is used to control the autopilot systems. It is similar in nature to a Mode Control Panel from large airliners.

The APCP is logically structured such that major systems are shown along the top row. Each is a push button which toggles the system on or off, as well as an illuminated **OFF** status. When **OFF** is displayed, the system may have been switched off by the pilot or the system may be inoperative due to a failure or lack of electrical power.

A. TRIM or AUTO TRIM is a system which controls the trim and feedback forces of the cyclic control. It allows the pilot to fly the helicopter hands-off and to intervene by using a CYCLIC TRIM RELEASE button or by manually pushing on the springs of the trim system, which either pauses or provides follow-up movement of the trim.

BKUP or BACKUP SAS is an independent system which provides only 3-axis basic stabilization. To remain on always, but only used in the event of AP1 and AP2 failure.

AP1 and **AP2** are redundant autopilot systems, implemented in the aircraft management computers. These systems provide both basic stabilization (SAS) as well as UPPER MODES like HDG, NAV, ALT etc. When both systems are enabled, one will act as the primary and the other will operate in a standby mode, ready to take over if the primary system should fail. AP1 and AP2 require **AVIONICS (AVIO 1 or AVIO 2)** to be switched to ON.

Upper Modes

Each of the upper modes knobs has a push function which toggles the mode, as well as left and right turn which changes the bug or setpoint for that mode.

The VS/HDG butterfly knob switches between traditional (HDG and VS) and GPS (TRK and FPA) modes. When switched to GPS the VS mode will become FPA and the HDG mode will become TRK.

Collective modes below (CRHT, IAS, ALTA, VS/FPA) will have the 4-axis autopilot use the collective control, so engagement will prevent you controlling your collective axis, unless you hold COLLECTIVE TRIM RELEASE.

Collective Modes

CRHT or Cruise Height works like an altitude hold, but uses the radio altimeter as the reference. This will result in a rough ride but enables the helicopter to traverse hilly terrain. This feature is designed for use over water.

IAS or Indicated Airspeed works the same as a fixed-wing airspeed hold.

ALTA or Altitude Acquire. When you turn the knob the bug will move, but your aircraft will not change from the current mode (even if **ALT** is selected). This mode works as a way to allow a preselection for a new altitude, and then it will use the **VS** mode to move from your current altitude to the new altitude. Once at the new altitude, **ALT** mode will be automatically engaged and the new altitude will be held.

VS/FPA or Vertical Speed/Flight-Path-Angle works the same as a fixed-wing vertical speed hold. When in FPA mode the aircraft speed is taken into account, allowing a descent angle to be defined. Useful with the FPV (Flight Path Vector) available on the SVS (Synthetic vision) view.

ALT or Altitude Hold works the same as fixed-wing altitude hold mode. It uses the barometric altitude and maintains it. Note that the only way to change the setpoint for ALT mode is by using COLLECTIVE BEEP TRIM or by switching to ALTA mode.

Roll/Yaw Modes

HDG/TRK or Heading/Track Hold works the same as fixed-wing heading hold, however it will use roll to accomplish the task at higher speeds, and yaw while in hover domain (under 30kt).

Track will consider the current wind and pick a heading that allows a straight line to be flown despite a crosswind.

Modes not on the APCP

NAV or Navigation mode (as well as **APP** and **V.APP**) is engaged by selecting a navigation source on the pilot MFD (use the NAV softkey on the MFD to pick between GPS, NAV1 and NAV2. The CPL softkey to couple the source to the AP)

GTC or Ground Trajectory Command mode is engaged by pressing AP/GTC binding or the Tablet autopilot panel.

GTC.H or Ground Trajectory Command in Hover submode is engaged by double-clicking

AP/GTC binding or the Tablet autopilot panel.

ATT mode is automatically engaged in the absence of an upper mode on the axis.

GA or Go-Around mode is engaged when pressing the COLLECTIVE GA control

Beep Trim

When any of the above modes are active, you will find that context-sensitive “beep trim” control is available. You can assign these to a hat, or click the buttons on the Tablet autopilot panel. These context sensitive modes will intelligently change the correct bug for the modes that are engaged. For example if you have ALT engaged, CYCLIC BEEP TRIM UP (and down) will control the altitude bug. If you were in VS mode, CYCLIC BEEP TRIM UP (and down) will control your vertical speed bug.

AFCS (Autopilot)

See [Systems - AFCS](#).

Helionix Avionics Suite

The Helionix system consists of 3 identical multi-function displays (MFDs), as well as two aircraft management computers and an array of sensors and hardware.

MFDs

Each MFD has 6 buttons on each side (top, right, bottom, left). When the button has a function, text will be shown on the MFD display directly adjacent to the physical button.

The buttons along the top of each MFD operate the main pages which the display can show.

Each MFD also has buttons to adjust the intensity of the various layers:

- LUM: Overall display luminance
- CTRS: Weather and Terrain overlay intensity
- BRT: SVS and DMAP underlay intensity

Page Name	Function
FND: Flight and navigation display	Top: PFD (Primary Flight display) Middle: Navigation Bottom: Aircraft (Message list, fuel)
NAVD: Navigation display	Navigation information, route display, map overlays (terrain, weather, topo)
VMS: Vehicle Management Systems	Aircraft and systems information
DMAP: Digital Map System	Map information streamed from online service
MISC: Miscellaneous	Used for display of auxiliary cameras
EFB: Electronic Flight Bag	Used for offline and online EFB functions. Not installed.

Note: When using ConfigTool or H:Events the MFDs are identified by the numbers, 1, 2 and 4. The pilot MFD is 2, the center MFD is 4 and the copilot MFD is 1.

34. Outside air temperature indicator
35. BRT – Underlay brightness (SVS, DMAP)
36. MFD Knob with push function

First Limit Indicator (FLI)

The FLI is presented on the FND page and communicates to the pilot the combined power-plant limits: Engine/MGB torque (TRQ), Engine N1 compressor speed (N1), and Engine turbine output temperature (TOT). The background of the FLI tape is the collective position, from 0 degrees pitch to 10 degrees.

When exceeding limits, you should expect the NR to fall (if N1 capability is exceeded) and excessive torque will cause engine wear and MGB damage. Except in failure, the FADEC will not exceed N1 or TOT limits.

All Engines Operative (AEO)

When all engines are operative, the FLI indicates the power limits, usually based entirely on torque. The pilot should take care to avoid exceeding the transient power limit (1), use of the range between the maximum power limit (2) and transient power limit (1) is permitted only for unintended use, up to 2 seconds. The blue line (4) indicates the amount of power which will be immediately available should an engine fail. If the current collective position is above the blue line and an engine should fail, the pilot would immediately need to lower the collective otherwise rotor RPM would begin to decay. The takeoff power limit (3) is available for 30 minutes, and then collective power should be reduced to maximum continuous power (bottom of (3)). The power rating timer (10) will be visible 90 seconds prior to 30 minutes elapsing

1. Transient power limit (teardrop)
2. Maximum power limit
3. Takeoff power (30 minutes)
4. OEI power limit
5. Current power setting

One-Engine-Inoperative (OEI)

The FLI will clearly indicate the OEI status (6) and show the power limits available. Using the OEI HI/LO button, the pilot may switch between use of the 30 second and 2 minute OEI power bands. When collective position exceeds the capability of the engine, the rotor rpm will drop.

6. OEI (One Engine Inoperative) flag
7. Topping signal (FADEC limit)
8. 30 second OEI power rating
9. 2 minute OEI power rating
10. Power rating timer

Airspeed indicator

1. VNE (velocity never-exceed speed, airframe limit). This is calculated based on your weight, outside air temp and pressure altitude. It will slide up and down based on those factors
2. GPS Ground Speed (this is intended to be shown as a digital value if it is off-scale, but I didn't do that)
3. VNE Power Off (velocity never-exceed speed while in autorotation). This is the same as above, calculated from charts and intended to be used should both engines fail
4. Current airspeed (IAS)
5. Speed bug
6. VY (Best climb speed)
7. Not shown: VTOSS (Takeoff Safety Speed) at 45kt. This is a minimum takeoff speed for engine failure
8. Not shown: CHK VNE (Check VNE speed). Occurs when avionics cannot calculate VNE

Stopwatch (chronometer)

Use the CLOCK sk to cycle between local time, stopwatch and off.

In Stopwatch mode, use the MFD knob push function as follows.

- First short press starts the stopwatch
- Second short press stops the stopwatch
- Long press while stopwatch is running resets and restarts stopwatch
- Long press when stopwatch is not running resets stopwatch

Set altimeter (BARO)

There are 3 altimeters in H145 (pilot, copilot and IESI). Change the MFD altimeter setting (kohlman setting) with this procedure:

1. Select the BARO key, the BARO text will illuminate white in reverse video.
2. Turn the MFD knob to increase or decrease the current altimeter setting. Press the knob for STD/1013/29.92.
3. Select the BARO key again to exit the mode

NOTE: Change units between in/hg and hpa in the tablet aircraft app.

HSI View

HSI mode displays a navigation source and deviation range.

SCT (Sector) View

Sector mode displays a 60 degree situation view with the flight plan line and navigation source as well as weather radar.

HOV (Hover) View

Hover mode provides brown GPS-based ground-speed lines which can be used to hover precisely without suitable ground reference. Hover mode is also useful in GTC mode as it displays the green digits corresponding to the current trends that the GTC mode is maintaining.

SVS (Synthetic vision)

The PFD will operate in both FDS (blue sky, brown ground) and SVS mode which enables a synthetic vision background. Note that in SVS mode the pitch scale is compressed in FDS mode and expanded to 1:1 scale in SVS mode. SVS is available on all 3 MFDs and may be combined with all other modes.

Wind indicator

The wind indicator is shown on both the FND and NAVD pages.

Each long feather is 10kt
Each short feather is 5kt
The triangle is 50kt
The circle is wind calm.

	Wind calm
	Wind 25kt
	Wind 50kt
	Wind 75kt

NAVD Page

Navigation Display

1. NAV sk - change nav source (NAV1, NAV2, GPS/FMS)
2. Next waypoint information
3. Ground Speed and True Airspeed
4. MAP sk - toggles the hill shading layer
5. RNG sk - map range (use the knob to control range)
6. Bearing 1 sk - Cycle bearing 1 (NAV1, GPS, hidden)
7. Bearing 2 sk - Cycle bearing 2 (NAV2, GPS, hidden)
8. FMS destination time and fuel estimation

9. Bearing frequency, distance and identifier
10. FMS waypoint and destination information
11. DATA sk - Show information on all nav sources
12. CPL/DCPL couples the AFCS to the selected navigation source
13. SCT/ROS/PLN sk - ROSE or SECTOR or PLAN view
14. WXR sk - Toggle weather overlay. (FAIL and STBY indicate WXR panel switch position)
15. HTAWS sk - Toggle terrain aware overlay (green/red)

NAVD Page (DATA subformat)

The DATA select key will reveal information regarding all installed navigation sources.

NAVD Page (Sector view)

Sector view provides a 60 degree situation view in front of the aircraft.

The other views are

ROS: (Rose) - A 360 degree situation view with the aircraft heading oriented upward.

PLN: (Plan) - A 360 degree situation view with North oriented upward

VMS Page - Engine indications

Starting engine (starting limits)	TOT limits: Max: 760C Transient: 840C Transient starting TOT is allowable for up to 10 seconds.	
Engine idle (no limits)	IDLE detent is to be used for starting, ground operations, and cool-down after flight. No limits are applied when the engine is in IDLE.	
Two engines in FLIGHT (AEO limits)	Note the presence of the amber takeoff power band on all three Torque, TOT and N1. NOTE: Limits are computed and will vary based on pressure altitude and outside air temperature.	

Takeoff power (TOP) (AEO limits)	The amber band is takeoff power and is available for 30 total minutes per flight. A white timer will be displayed when 90 seconds are remaining. After 30 minutes power should be reduced to maximum continuous.	
Transient exceedance (AEO limits)	Transient power is available for unintended use for up to 12 seconds. A gong sound will play at the beginning of each exceedance.	
FADEC Failure (no limits)	Level 3 FADEC failure -Fuel valve is frozen and the engine cannot respond to commands to change the N1. Use FADEC EMER to attempt recovery to level 2 FADEC failure.	
One engine in flight (OEI limits)	OEI (one engine operative) limits are displayed as lines. Note that the OEI limits are much higher than AEO limits.	
OEI - 2 minute rating	The amber band is the 2-minute power rating when only one engine is operative.	
OEI - 30 second rating	The red power band is the 30 second power rating. Note the red topping triangle (OEI HI and OEI LO) setting controls whether the FADEC will allow use of the 30 second rating or instead droop the NR when commanding more collective power.	

VMS Main Page (MAIN subformat)

The main subformat contains two panels. The right panel is used for NR and N2 indications, and the left panel has a page controlled by the DATA select key.

Pressing the DATA key will cycle through

WEIGHT & PERFORMANCE	Aircraft weight and estimations on performance margins	DATA WEIGHT & PERFORMANCE TOTAL WEIGHT7540 Lb AEO HIGE8077 Lb AEO HOGE7452 Lb CAT A VTOL7391 Lb OEI 2min HOGE7196 Lb OEI 30s HOGE7368 Lb STATUS REPORT
TIME ZONE	Displays the current sim time zone and current local time	DATA TIME ZONE UTC-07h00 10:43:20 STATUS REPORT
HOIST CABLE LENGTH	If installed, the hoist length reeled out will be displayed here. Only available with Medical, Firefighter, Offshore variants.	DATA HOIST 0 feet STATUS REPORT
CARGO HOOK WEIGHT	If installed, the cargo hook weight detection is displayed. Only available with Firefighter, Offshore, Cargo variants	DATA CARGO HOOK STATUS REPORT

VMS Main Page (STATUS subformat)

The Status page displays information about the FADEC which is generally used by maintenance only.

FADEC 1		SYSTEM STATUS	FADEC 2	
1013	HPA	P0	1013	HPA
14.9	C°	T1	14.9	C°
5.1	%	CLP	5.1	%
102.1	%	N2	102.1	%
		N2 DATUM	102.0	%
14.9	C°	FUEL TEMP	14.9	C°
		MM	0	%
PREV		REPORT	CONF	WEIGHT

VMS Main Page (REPORT subformat)

The Flight Report page displays information about the most recently conducted flight

1/4		FLIGHT REPORT 20	
BLOCK TIME:		0 h 29 mn	VALIDATED
FLIGHT TIME:		0 h 0 mn	
NEXT	FLT / CUM	CYCLES	FLT / CUM
	1 / 5	N1	1 / 4
	1 / 7	N2	1 / 5
PREV		STATUS	CONF WEIGHT

VMS Main Page (EPC subformat)

The Engine Power Check page displays the interface to conduct an on ground or in flight power check.

EPC is not currently implemented.

VMS Main Page (CONF subformat)

The Configuration page displays information about the Helionix configuration which was loaded.

CONFIGURATION - SYSTEM	
AUXILIARY FUEL TANK	NOT INSTALLED
FUEL FLOW SENSOR	INSTALLED
ENGINE INLET FILTER	NOT INSTALLED
HOIST	NOT INSTALLED
CARGO HOOK	NOT INSTALLED
MASTMOMENT SYSTEM	LINEAR
PREV	STATUS REPORT WEIGHT

VMS Main Page (WEIGHT subformat)

The Weight page is used to program the aircraft weights before flight.

Press VAL when finished to commit the weights.

WEIGHT COMPUTATION	
PAYLOAD	0 KG
CREW	155 KG
EMPTY EQUIPPED	2005 KG
TOTAL FUEL	340 KG
TOTAL	2495 KG
PREV	STATUS REPORT CONF

Use the **PUSH** function of the MFD knob, to advance the weight entry between PAYLOAD, CREW, and TOTAL FUEL entry lines. All items will be updated immediately when you spin the MFD knob. Both the small and large knobs are active, enabling large and small increments of both payload and fuel.

NOTE: Using the in-aircraft WEIGHT tool will not cause the MSFS weight dialog to update. The aircraft will be updated from changes to either location, but the changes are not reflected back in the MSFS weight dialog unless you only use that tool for weight entry. In any case the aircraft will show its accurate weight and fly using those numbers.

VMS Page (System format)

The System page is used to display status on equipment connected to the aircraft (shown at the top) and on the AFCS system (shown at the bottom).

1. Equipment status area
2. AFCS status area
3. AFCS Trim actuator status
4. AFCS SEMA type actuator status
5. APCP (Control Panel), Collective control and Cyclic control status
6. AFCS system status
7. Return to main VMS format
8. Switch to RCNF (Reconfigure) VMS format

AFCS System Status legend:

- Green**: Active
- Cyan**: Standby
- Red**: Inoperative
- Gray**: Disabled by upstream fault

VMS Page (Reconfigure format)

The Reconfigure format is used to display information about the system configuration regarding the AHRS and ADC, Magnetometers and RA. The top of the page shows each MFD and which configuration it is currently using. The bottom of the page shows the individual sensors and their current readings.

SYST: Switch to the SYST/System VMS format
 PREV: Switch to the main VMS format
 DG: This DG (Directional Gyro) is currently in free mode. The CCP is used to switch the Dgs from free to slaved (to the magnetometer) and to slew the heading reference when in free mode.

Selective reconfiguration of sensors by the user is currently inoperative.

DMAP Page

Digital Map

1. LAYR sk - Toggle airspace visibility
2. Aircraft magnetic heading
3. MAP sk - Toggle between OSM and OpenTopoMap layers
4. PLN/ROS sk – Toggle between NorthUp and HeadingUp views
5. WXR sk - Toggle online weather overlay
6. Inop.
7. HTAWS sk – Toggle HTAWS height above terrain overlay

Use the MFD knob to control the range of the map.

Data Sources (Advanced)

The map data source is driven by slippy tile xyz sources in:

Community\hpg-airbus-h145\html_ui\HPGH145-User\MFD\DMAP.json.

The API format is OpenLayers2 (not leaflet). See here for more providers:

<http://leaflet-extras.github.io/leaflet-providers/preview>

MISC Page

Miscellaneous, used for auxiliary camera sources. The MISC page is available on MFD1 (copilot) and MFD4 (center).

The tail boom camera is available on all variants. The camera itself is a view provided by MSFS and composed from the satellite imagery overlaid on the 3d synthetic vision viewport.

The select keys at the bottom for LOW and HIGH are mutually exclusive.

LOW (Default): Camera will not be updated with aircraft pitch and bank information.

HIGH: Camera will be updated with pitch and bank information, which appears to have a modest cost in sim performance but enables a more realistic view.

When multiple camera sources are available, AUX1 and AUX2 will be displayed in the upper left of the MISC page. Only one source may be visible at a time.

When using the H145M variant, the weapons status page is shown as a camera source. See the Weapons System section for more information

GTN750 Flight Management System

The GTN750 acts as a flight management system, letting you manage the flight plan, locate nearby airports, view maps, and more. While both software integration options (by pms50 and TDSSim) are optional (the aircraft is usable without either option), it is highly recommended to select one.

The pilot GTN750 is powered by both the avionics 2 bus and the essential 2 bus. This means that as long as the battery master is on, the GTN750 on the right side will have power. The copilot GTN750 is powered by only the avionics 1 bus. You will need to use the AVIO 1 switch on the overhead panel to gain access to the left GTN750. Note also that COM2 and NAV2 are on the pilot (right) side of the aircraft, and COM1/NAV1 on the left side.

GTN750 Software Options

Mode	Installation Procedure
Pms50 GTN750 (Recommended)	Install the pms50 GTN750 . You will have two folders within Community: hpg-airbus-h145 pms50-instrument-gtn750
TDSSim GTNXi	Purchase and install the TDSSim GTNXi . On the H145 tablet, go to the Aircraft app, Options page, and select GTN Software to TDSSim GTNXi . You will have two folders within Community: hpg-airbus-h145 tds-gtnxi-gauge
Pms50 + Working Title Technology (WTT)	Install the pms50 GTN750 . In the H145 tools folder, extract hpg-airbus-h145-pms50gtn750-wtt-v2.zip You will have three folders within Community: hpg-airbus-h145 hpg-airbus-h145-pms50gtn750-wtt-v2 pms50-instrument-gtn750 Inoperative for version 2.0
No GTN750 (Not Recommended)	The GTN750 provides important flight management functions which would not otherwise be available, however a flight plan may still be selected and used from the world map. You will have only one folder within Community: hpg-airbus-h145

Pms50 GTN750

The free version is suitable but the premium version adds many features including navigraph charts, checklists and more. The addon is not included in the H145 download, check the installation instructions earlier in this guide for specific installation steps.

A **Not Installed** message indicates that the GTN750 addon was not discovered. Check your Community folder for the pms50-instrument-gtn750 folder

Checklists

To install the checklist follow this procedure: **(Premium GTN750 required)**

1. Unpack the checklist zip file. Rename HPG_AirbusH145_The1L2P.json to import.json and place the file into Community\pms50-instrument-gtn750\checklists\gtn750. Overwrite the existing import.json file.
2. Inside MSFS: In the GTN750 click on: System -> Setup -> Checklists -> Import local file
3. You'll find the checklist under Utilities -> Checklists.

Registration

The GTN750 registration page is for the premium GTN750 license. **Do not enter your H145 license key into GTN750.**

Disable an individual FMS unit

Push buttons may be used to blank the FMS screen and disable processing for that MSFS gauge.

TDSSim GTN750

The TDSSim GTN750 is integrated as 2 units, with unit 1 on the copilot side. You should manually set the navigation source to unit 2 to select the pilot unit. The invisible click spot is not implemented in the VR to switch navigation sources.

The TDSSim GTN750 does not currently save the flight plan into MSFS, so the NAVD and DMAP displays will not show the navigation route

Operating the GTN750

Direct-To airport procedure

If you have an existing flight plan, a Direct-To will replace it with a new flight plan that goes from your current position to the destination. Start from the GTN750 Home page. If you don't see the home page, select the HOME button and you will see a grid of icons. The destination may be found by selecting a nearby airport from a list or by selecting the 4-digit ICAO airport code.

After activating a Direct-To flight plan, you can use the tablet autopilot panel to select the GPS navigation source, or you can use the NAV and CPL softkeys on the pilot MFD to select and couple the navigation source.

Direct-To: Select a nearby airport

1. Select Nearest 	2. Select Airport 	3. Select an airport 
4. Select the Direct-To button	5. Select Activate	

Direct-To: Select an airport by name

1. Select Waypoint Info 	2. Select Airport 	3. Select --- 
4. Type an ICAO (e.g. KSEA) 5. Press ENTER 	6. Select the Direct-To button 	7. Select Activate 

NOTE: WTT Mode is inoperative with version 2.0!

Aircraft Lights

The H145 lights are configurable by the user in the tablet aircraft app. Lights are similar to fixed wing operation, the LDG and S/L will often be used together for any night takeoff and landing.

Lights are primarily controlled by the lighting section on the overhead, as well as controls on the Collective Head.

Lighting Controls

1. High Intensity Search Light - Lamp (if installed)
2. Landing (LDG) Light
3. Strobe Lights
4. Position/Navigation (POS) Lights
5. Anti-collision (ACOL) Beacon Light
6. Cargo/Passenger area Lights (inoperative)
7. Emergency Exit Lights
8. Instrument Panel Light Dimmer switch.
9. Instrument Panel Light Day/Night/Night-Vision-Goggles mode switch.

Instrument Panel lights

Instrument panel lights are available in DAY, NIGHT and NVG modes. DAY mode switches the panel lights off, while NIGHT and NVG enable the integral (green) panel lights. Use the dimmer switch (8, above) to adjust the light intensity.

DAY, NIGHT and NVG will also impact the base brightness for the MFDs.

Cockpit lights

There are two cockpit lights available at the front and rear of the overhead panel. Click the light itself to activate.

Cockpit lights are available when the master battery switch is ON or when the Ground Power switch is set to ON (not to be confused with External Power). When using Ground Power without the aircraft battery, the lights will be switched off after 10 minutes.

Exterior lights

1. Landing (LDG) Light
2. Second Landing Light
3. Search and Landing (S/L) Light
4. Landing (LDG) Light - (Optional if the radome is not installed)
5. Boarding step light
6. Hoist light (automatic activation)
7. Navigation/Position (POS) Lights (left - red, right - green, rear - white)
8. Strobe (white) and Beacon (red) lights

Emergency Exit Lights

Exit lights (4) are installed in the cabin and cockpit. They are powered by both the main battery and the standby battery.

- The exit lights will illuminate when
1. EM/EX switch to ON
 2. EM/EX switch set to ARM (armed) and one of the following
 - a. Hard landing
 - b. Door opens
 - c. Loss of electrical power

Emergency Floats

The emergency flotation system installed permanently on the Luxury and Offshore variants. Floats are optional on the EMS, Civil Cargo and Firefighter variants.

The system must first be armed using the switch on the overhead panel, and then it can be activated either automatically or when the pilot activates the **FILL FLOATS** function.

Access the fill floats and repack functions by clicking the top clock on the tablet and then clicking the button on the Emergency Floats notification in the list.

Function	Action	Notes
Arm / Disarm	Use the switch on the overhead panel, EMER FLOATS and set it to ARM or OFF	
Activate	Automatic activation upon water landing. Manual activation is accomplished by a button on the tablet, or the FILL FLOATS binding.	Automatic activation when landing on water is mandatory.
Repack	Use the Tablet Aircraft app, click the top clock, and select Repack on the notification.	Not a realistic function
Test	Set EMER FLOATS to TEST	This test is checking for power from both electrical sources.

Fuel System

The H145 has a fuel system that consists of a main (center) tank, two supply tanks (right and left, connected only to the respective engine on that side of the aircraft), 2 transfer pumps to move fuel from the main tank into the supply tank, and 2 prime pumps to move fuel from the supply tank to their respective engine.

There are 4 fuel pumps. The two transfer (XFER) pumps move fuel from the main (center) tank into the supply tanks. Both transfer pumps will move fuel independently from the main tank into both supply tanks. The two prime pumps move fuel from the supply tank to the engine on that side of the aircraft. The two prime pumps should both be switched ON during engine start, and OFF after both engines are running. Transfer pumps should be switched on after engine start and remain on until just before engine shutdown

Information about the fuel system is presented on the FND and VMS pages, as well as critical indications on the message list and on the Warning Unit.

- Even when the main tank is empty, the transfer pumps are to remain ON.
- A red line indicates that the transfer pumps are not active and cannot move fuel from the main tank to either supply tank.
- The fuel system has been designed such that the left engine will shut down from fuel starvation before the right. Should this ever occur an immediate landing shall be conducted.
- Display units and presence of Fuel Flow sensor may be set using the tablet Aircraft app.

The warning unit contains low fuel warnings relating to the supply tanks only. The red guards may be lifted to engage an emergency fuel cutoff for the engine should a fire occur.

Electrical System

The H145 has a 28V DC electrical system consisting primarily of:

- Aircraft main battery
- Standby battery
- Bus tie (x2)
- Combined Starter/Generator (x2)

The two sides of the aircraft are redundant and split into system 1 and system 2. Critical equipment is powered by both systems. There are additional shedding buses on each system which are left unpowered unless both electrical generators are running or external power is connected. Each system has a bus tie which allows the system to be isolated (normally they are not isolated to allow sharing of electrical loads) When bus ties are closed, both systems can use power from the main battery or either generator.

BUS TIE (1 and 2)

Bus tie connections are used to isolate a system from a malfunction within another part of the aircraft. They shall remain in the NORM and guarded position unless directed by a checklist. When switching a bus tie switch to the NORM position from OFF, it should first be moved to the spring-loaded RESET position.

GEN (1 and 2)

Generator switches may be used to isolate a malfunctioning generator from the rest of the aircraft. They shall remain in the NORM and guarded position unless directed by a checklist. When switching a generator switch to the NORM position from OFF, it should first be moved to the spring-loaded RESET position.

EMER SHED BUS

The Emergency Shedding Bus is a third optionally isolated part of the electrical system. The EMER SHED BUS switch shall remain in the NORM (off) position unless directed by a checklist. The Emergency shedding bus provides power to the IESI and emergency exit lights, and also provides an alternate path for the Radar Altimeter. If you should lose both generators in flight you may recover the RA parameter by switching the EMER SHED BUS to the ON position.

BAT MSTR

The BATTERY MASTER switch is the main aircraft power switch. It has 3 positions, OFF, ON and ENGAGE. When switching from OFF to ON, it shall first be moved to the spring-loaded ENGAGE position. This act activates the bus tie system and closes the BUS TIE 1 and BUS TIE 2 connections. Failure to move the switch to the ENGAGE position will result in BUS TIE OPEN messages on the message list as well as failure to share electrical load between systems 1 and 2.

DC RECEPT

The D.C. Power Receptacles switch controls a utility bus which may be used to charge the onboard tablet.

STBY BAT

The STANDBY BATTERY powers the IESI, exit lights and the emergency shedding bus when isolated. It should be engaged for flight and shut off after shutdown, otherwise the IESI may remain powered after shutting off the master battery switch. There is no indication on the VMS page for the standby battery. If it is discharging a notification will be present on the message list

AVIO (1 and 2)

Avionics bus 1 and 2 power critical avionics equipment such as the aircraft main computers. AVIO 1 is required for the copilot GTN750 to function. The AP1 and AP2 functions on the APCP depend on AVIO 1 and 2 respectively.

VMS electrical information section

The VMS page contains a section for electrical information, showing the status of both generators and the aircraft main battery. The VMS NUM sk can be used to reveal nominal digital parameters.

WHITE: Source is not active
GREEN: Source is active
YELLOW: Source is over limit

External Power

The tablet may be used to connect and disconnect external power. An icon will be displayed in the notification bar if the external power unit is available or connected. A message in the notification list may be used to CONNECT and DISCONNECT external power.

Note: External power will not power the aircraft unless the BATTERY MASTER switch (and subsequently the bus tie system) is ON.

Weather Radar

Weather radar is available as an option in the civilian variant, and always available in the luxury variant. The exterior radome option and weather radar are installed together. You can select the radar option in the tablet aircraft app.

Weather radar is available on the FND and NAVD pages. The DMAP page and the tablet Maps app use an online weather service which works irrespective of the selected radome option.

The weather radar is controlled via the WXRCP panel on the center console. The main knob has 4 functions (OFF, Standby, TEST, and On). STBY mode is used when on the ground. TEST mode is used to display a test pattern on the FND and NAVD pages when weather has been selected.

Message	Meaning	Notes
FAIL or WXR FAIL	Weather radar is not detected electrically. Set the WXRCP knob to ON.	Radome must be installed for WXRCP to be visible on the center console.
STBY or WXR STBY	Weather radar is detected but in standby mode. Set the WXRCP knob to ON.	
CHECK RANGE	MFD4 and MFD2 range knobs must match, or WXR should be de-selected.	MFD1 has independent range.
WXR TX INHIB	Weather radar is automatically inhibited when less than 50FT RA to protect personnel.	Weather radar will become available automatically when crossing 50FT RA.

Engine Filters (IBF)

Inlet Barrier Filters protect the engine from abrasive sand causing excessive wear on the engines. The filters block sand and dirt but will eventually become clogged which will reduce engine performance. The pilot may control the operation of the bypass doors, which allow a way for air to directly reach the engine, bypassing the filters. It's best to keep the IBF system in the NORM position unless operations require otherwise. **Clogging over 100% will reduce engine performance.**

IBF controls are on the overhead panel, and IBF indications are on the VMS page and on the Message List.

Each IBF switch corresponds to the respective engine, and has 3 positions as explained below. The Recall switch is currently inoperative

CLOSED: Bypass doors are closed and will not open automatically. The filters will protect the engine but in the case of OEI the bypass doors will not open automatically, meaning full power will not be available.

OPEN: Bypass doors are open and the engines are directly exposed to outside conditions.

NORM: Bypass doors will automatically open and close based on the relevant systems logic. Bypass doors will normally stay in the closed position but will open automatically in the case of clogging over 100% or in the case of OEI.

Bypass door open	With the bypass door open (either due to the switch or by automatic logic) the engine has maximum performance but sand will cause excessive wear.	
Clogging	IBF clogging up to 100% will not reduce engine performance. IBF CLOG TREND message will be associated with early clogging.	
Excessive clogging	IBF Clogging over 100% will result in performance degradation, OEI performance margin will not be guaranteed.	

Clogging levels may be controlled in the Failure & Maintenance app. Clogging is disabled when the Aircraft Damage is set to Off in the Aircraft app on the setup page.

Failures & Damage Model

The H145 has a suite of failure modes and also a systems damage model for key aircraft systems. These features can be optionally disabled in the tablet Aircraft app, on the Setup page by setting **Aircraft Damage** to **Off**.

Failure & Maintenance app

The Failures page shows a list of any active failures, and the maintenance page shows damage and degradation status.

Do All Maintenance: This will reset all damage

Aircraft failures are best triggered from within the mission system, as various timers or triggers may be devised to enter or exit the failure condition.

Aircraft Failure Variables

Scope	L:Vars
Engines	0-100 (percent damage) L:H145_PERSIST_DAMAGE_ENG1_PCT L:H145_PERSIST_DAMAGE_ENG2_PCT 0 or 1 (boolean logic) ENG ON FIRE:1 ENG ON FIRE:2 GENERAL ENG FAILED:1 GENERAL ENG FAILED:2 L:H145_FAIL_FADEC1 L:H145_FAIL_FADEC2 Note: Using FADEC EMER will recover from level 3 to level 2 failure and thus regain substantial engine control by use of TOT-matching the engines. Bottles 0: empty, 1: charged L:H145_SDK_FIREBOTTLE_1 L:H145_SDK_FIREBOTTLE_2 H:H145_SDK_FIREBOTTLE1_EMPTY H:H145_SDK_FIREBOTTLE1_FULL H:H145_SDK_FIREBOTTLE2_EMPTY H:H145_SDK_FIREBOTTLE2_FULL

Hype Tablet

The tablet may be opened or closed by clicking the hinge. The home button will close apps until there are no more apps open, then will also close the tablet. If you use the hinge you may keep the app open while the tablet is closed. The tablet battery will drain if you do not turn on the helicopter and also engage the DC RECEIPT switch.

Tablet Hinge: Click the hinge along the left to open or close the tablet.

Home Button: The home button will close the current app (or view) until showing the home screen, and then one more press will close the tablet.

Status bar: Action Center is available by clicking the status bar at the top of the screen

Apps

Aircraft	Configure the aircraft here
Failures & Maintenance	Configure aircraft failures and restore aircraft damage here.
Missions	Discover and execute missions here.
Documents	View image charts of your choosing. A copy of the user guide and normal procedures is also included here.
LittleNavMap	View the LittleNavMap.exe view from the tablet.
Sound Mixer	Adjust aircraft sound intensities here.
Maps	View maps.
Alarms	Set alarms and timers.
METAR	Query METARs for airports (live weather).
Web	Access select (very restricted) web pages directly.
EFBConnect	Mirror web pages into the simulator.
Flappy Bird	A simple game (to be used only on the ground).
Neopad	Access the NeoFly app
Direction Finder	Configure the DF hardware with a location.
Event Tester	Test the Home Cockpit SDK events without first binding the controls.

Aircraft (Setup)

The aircraft app combines unrealistic functionality with required setup and equipment and options configuration.

Setup

Setting	Options	Notes
Gameplay Mode (Flight Model)	Realistic Arcade	Realistic mode is the default flight model and is much more advanced. Arcade mode is an older version which some users may prefer but is not recommended. Arcade mode will also disable advanced flight model features: - Rotor overspeed and underspeed - Vortex Ring State - Aircraft Damage
Rotor Torque	Off / On	Rotor Torque is the normal tendency of the aircraft to pull to the right unless countered with the left pedal. The real H145 has trimmable pedals which operate in sync with the AFCS, so both settings can be considered reasonable. You may prefer the Off setting if you do not have physical rudder/yaw pedals.
Vortex Ring State	Off / On	VRS is a dangerous condition where the aircraft descends into its own downwash. Not available in Arcade mode.
Aircraft Damage	Off / On	Damage to Transmission and Engines, IBF simulation that will restrict engine airflow and subsequent power available

		Not available in Arcade mode.
AFCs ATT Follow-Up Trim	Only Cruise Only Hover	When in ATT mode (blank on the MFD), this setting controls whether trim release is required at lower or higher speeds.
Cyclic Sensitivity	(-10)-(+10)	This setting is intended to compensate for a cyclic control which is longer or shorter (like an xbox controller or a more professional control setup)
Cyclic Deadzone	1%-100%	This configures the deadzone used by the AP to determine when you are pushing on your joystick controller vs leaving it neutral/at rest. Select the lowest value that still results in your controller being consistently detected correctly (yellow=you are pushing on it, white=at rest)
Pedals Deadzone	1%-100%	Same as above, but for pedals
AirlandFS Flight Model	(not present) Active	This item is shown only when AirlandFS has configured the aircraft for external flight model use. Once AirlandFS is closed, clicking Active will recover the integral flight model.

State Load	Options	Notes
Ready for Takeoff	Configures the aircraft for takeoff (engines, AFCs).	
Cold & Dark	Configures the aircraft for Cold & Dark at the ramp.	

Equipment

Setting	Options	Notes
Radome (Weather Radar)	Installed Not Installed	This option will be set by the livery author and may then be changed at any time.
External Weapon Pods	Installed Not Installed	Weapon pods on the right and left. Only available on the military variant.
Fabric Glare Shields	Installed Not Installed	Required for night flight, these fabric curtains block light from shining upwards from the ground onto the canopy window
Emergency Floats	Installed Not Installed	
Wire Strike Protection (Top, Bottom, Skids)	Installed Not Installed	This option will be set by the livery author and may then be changed at any time.
Skid Settling Protectors	Installed Not Installed	This option will be set by the livery author and may then be changed at any time. Not available on the luxury variant.
Air Conditioning	Installed Not Installed	This option will be set by the livery author and may then be changed at any time.
Fuel Flow Sensor	Installed Not Installed	Endurance calculation unavailable without fuel flow sensor
Inlet Barrier Filter (IBF)	Installed Not Installed	BF system protects engine inlets from sand ingestion while providing bypass doors for emergency power
ACAS (Airborne anti-collision system)	Installed Not Installed	Traffic alerts unavailable without ACAS
HTAWS (Terrain awareness system)	Installed Not Installed	HAT (height above terrain) database and aural warnings unavailable without HTAWS.

Options

Setting	Options	Notes
GTN750 FMS System Software	Pms50 GTN750 TDSSim GTNXi	See the GTN750 section of the user guide for more information. Restarting the flight is not necessary but it is not recommended to load both GTN750 software options concurrently.
Fuel Units	Lb (Pounds) Kg (Kilograms) L (Liters) Gal (Gallons)	
Weight Units	Kg (Kilograms) Lb (Pounds)	
Barometric Units	In/Hg hPa	Controls the baro readout on the 3 MFDs and IESI.
Temperature Units	C F	Displays the OAT (outside air temperature) value on the FND page in either fahrenheit or celsius
Rotor Downwash Effects	On	Particle effects on dirt/grass, sand, snow, water. Has GPU impact

	Off	
Pilot automatic hide	Head & Body Head Only	This setting controls whether you can slew into the pilot bodies in the cockpit Use the Head Only setting if you experience the pilot flickering based on your movements with TrackIR or VR
Rotor Blur Casts Shadow	On Off	Set to OFF to reduce flicker in cockpit
Show parking brake on tablet	On Off	Show of Parking Brake on tablet status bar. (Useful for VA/mission software that uses this as a cue to begin or end)
Tablet Clock/Time reference	PC Time Sim Time PC Time UTC	PC Time should match your Windows PC clock. Sim Time should match the time you see on the FND or VMS clock, or the MSFS Weather dialog.
Tablet Clock/time format	12-hour 24-hour	Display format AM/PM or 24 hour time.

Crew & Payload

Setting	Options	Notes
Seat Selection - Pilot Seat Selection - Coilot	Hype Asobo	Choose to use Hype pilot models or Asobo. Note only the Hype pilots may operate as headless
Seat Selection - 2	Crew Worker	Choose which human model type to use
Seat Selection - 3 Seat Selection - 4	Worker Survivor	Choose which human model type to use
Hoist Selection	Stowed Deployed Crew Crew+Stretcher Worker Crew+Survivor 1 Crew+Survivor 2 Containers Hose	Stowed (Hoist is stowed and off) Deployed (Hoist arm swings out) Choose the hoist objects currently attached. Note unless using a mission, the object will not automatically detach when reaching the ground Note options available vary per variant

Maps app

The maps app features zoom controls and the ability to change the map orientation between North-Up and Heading-Up modes. The current magnetic heading is also displayed in a digital/numeric value at the top of the page.

Click [...] to reveal the maps selection panel where you may select between a variety of map sources as well as airspace and weather overlays.

Advanced Configuration (Optional)

The maps app uses OpenStreetMap tile data. You may configure the sources and their relevant options through the configuration file located at:

html_ui\HPGH145-User\Tablet\MapsApp.json.

Edit this file to change from the default provider of

<https://{a-c}.tile.opentopomap.org/{z}/{x}/{y}.png>.

See here for more providers: <http://leaflet-extras.github.io/leaflet-providers/preview/>

Documents app

The Documents app is a simple image chart viewer app. It will show documents built into the H145, provided by your livery, or documents of your own choosing.

To show your own "user documents":

1. Install the [UserDocuments](#) package in your Community folder. You will install this new folder alongside the main hpg-airbus-h145 folder, don't put it inside of the main H145 folder.

2. Place your files in
hpg-airbus-h145-userdocs\
html_ui\HPGH145-User\Documents

3. Double click the script **Update Docs For Sim** in the UserDocuments. This will overwrite the Index.json which the sim reads the filenames from. It will also update the package layout.json. You must restart your sim after adding or removing files.

Neopad app

[Download Neofly and Neopad](#)

The neopad app is present ONLY if neopad is installed within the simulator. You should see Neopad on the sim toolbar. Once installed, the app will be visible on the tablet. The app will simply connect to the NeoFly app, so make sure the toolbar app is working as expected if you are having any problems.

The neopad server url may be changed via:

Community\hpg-airbus-h145\html_ui\HPGH145-User\Tablet\NeopadApp.json.

Web Browser

The browser app will load websites which have an access-allow-origin set to allow the game to access it, which is unfortunately rare. Web Browser app will load URLs from

Community\hpg-airbus-h145\html_ui\HPGH145-User\Tablet\WebBrowserApp.json.

EFB Connect (Web Browser)

EFBConnect is a companion app which runs on your PC and provides a web browser with more functionality inside the sim, including some ability to stream video.

Download EFBConnect from the H145 Download Center. It includes a quick start guide explaining the basic functionality (it is currently outdated and refers to H135).

EFBConnect will load to the configurable home page:

As soon as EFBConnect opens, the tablet EFBConnect app will automatically connect. You are able to send mouse clicks directly on the tablet in the sim, but currently you cannot scroll or zoom or use the back button.

Content that you view in the EFBConnect app will be mirrored in the sim, and light tasks may be accomplished directly through the sim.

LittleNavMap app

[Download LittleNavMap](#)

The LittleNavMap app contacts the LittleNavMap webserver. Click Tools then **Run Webserver** to start it. You can test that it is working by viewing the page in your browser.

Advanced Configuration

There is no need to change the below but the options are available if needed, especially changing the Url to another computer.

Configuration file: html_ui\HPGH145-User\Tablet\LittleNavMapApp.json.

Parameter	Values	Notes
Url	Default: http://localhost:8965	Server location (ip or host name including protocol)
FrameDelay	Default: 1000	Milliseconds to wait after receiving a frame before loading the next frame
Scale	Default: 1	Requested view size
ZoomScale	Default: 2	Zoom increment
Format	jpg or png (Default: jpg)	
Quality	0-100 (Default: 80)	JPEG compression level

Parameters are passed directly to the LittleNavMap web server.

Events Tester

The Events Tester app is intended as a simple way to check key bindings prior to selecting them in ConfigTool. Events Tester presents a list of categories and within each category are commands which correspond to functions in the H145. The command will execute each time you tap on the entry.

Missions

The missions app enables the user to conduct missions. See the top level Missions section in this document for more information.

Sound Mixer

The Sound Mixer app presents sliders to adjust certain aircraft sounds.

Name	Notes
Rotor Bladeslap	Heavier rotor blade sounds when the air collides with recently disturbed air. Lower values are recommended
Avionics Alerts - Critical	
Avionics Alerts - Advisory	
Crew Audio	Crew guidance audio. Not yet operative.

Direction Finder

The Direction Finder (DF) app presents an interface to set entries from DFApp json as the active DF source. The DF bearing pointer is available on FND and NAVD under the BRG1 and BRG soft keys.

The file location for entries is
`hpg-airbus-h145\html_ui\HPGH145-User\DFApp\index.json`.

Hype Radio

Listen to internet radio stations based on your flight simulator location. Start the Hype Operations Center app on your PC and then click Hype Radio on the tablet.

Radio stations will be updated every time you launch the app and the radio will remain playing even if you leave the range of the station, or go to the menu to change location.

Wallpaper

The tablet wallpaper is located at `html_ui\HPGH145-User\Tablet\wallpaper.jpg`

The wallpaper may also be set based on the currently active livery. See the **Livery Author Info** section for more info.

Action center

The Action Center is available from all apps and opens on top of any currently opened app. Click the clock to activate the Action Center.

Always-visible sections

These sections are available at the top of the Action Center under all conditions.

Tablet Brightness control	
Doors	
Autopilot	
Autopilot - extended controls	
Lights	
Lights - with extended HISL controls	

Contextual sections

These sections (or notifications) are available only when certain conditions are met

H145M Weapons	
---------------	--

TDSSim GTNXi Navigation Source	
One Engine Inoperative	
ELT Active	
Hoist Control	
Emergency Flotation System	
Ground Power Available	
Open Door	
Bambi Bucket	
Parking Brake Applied	
Rotor Braking Available	

Status bar

Icons in the status bar are always contextual based on equipment and conditions. Icons will appear and disappear based on events like the GPU being made available, and icons will use a background color to draw additional attention to specific statuses.

GPU status icons

	GPU is connected and on. You must disconnect prior to takeoff.
	GPU is available but not currently connected.

Cargo Hook (with Remote Hook) status icons

	Remote Hook is attached, no load, off the ground.
	Remote Hook is attached, no load, within range of attach/detach
	Remote Hook is attached, with load, off the ground
	Remote Hook is attached, with load, within range of attach/detach

Bambi bucket status icons

	Bambi bucket is attached, empty, and off the ground.
	Bambi bucket is attached, and below the ground level
	Bambi bucket is attached, has water, and above the ground level.
	Bambi bucket is attached and currently dumping

Other status icons

	One or more doors are currently open.
	Rotor braking is available
	ELT is actively broadcasting.
	Parking brake is on and the setting is also on to show it (normally hidden)

H145M Weapons Systems

The H145 military variant is equipped with optional external weapon pods. The weapon pods may be configured for a cannon or a set of 2.75" 70mm **FZ275 LGR** rockets. (currently operating as unguided missiles).

Livery authors can choose to set the weapon pods to be on or off by default. You can use the tablet aircraft app, on the Equipment page to turn the weapon pods on or off at any time during your flight.

The default key binding to fire rockets is covered in the key bindings section of this user guide, and is configurable via ConfigTool. You may also add a custom key binding for **Reload** if you wish.

You may also reload ammunition by clicking on the box behind you in the cockpit. The tablet has an indication of rockets remaining and a button to fire if you haven't set the key binding (click the top clock).

Weapons status is available on the MISC page on the center and copilot MFDs, as well as on the tablet Action Center.

The **Cleanup** function will immediately remove all rocket holes in the earth and rocket particles. This can be useful after firing many rockets to recover lost fps.

Sensor Pod & Monitor

The H145 military variant is equipped with a sensor pod which provides imagery to the internal monitor display. The pod rotates horizontally 180 degrees and vertically 90 degrees (full forward to straight down).

1. Power on/off
2. Pod heading
3. Move Right
4. Move Left
5. Move Forward
6. Move Aft

Key bindings may be configured in ConfigTool for the sensor pod functions.

Action Pack - High Intensity Search Light

The HISL is mounted to the front left skid and controlled with the control panel on the center console as well as a switch on the overhead for the lamp itself. There are also controls on the collective head.

1. System power on/off
2. IR status light (inoperative)
3. Laser control (inoperative)
4. System status display
5. STOW push button with status LED
6. DEPLOY push button with status LED
7. SLAVE push button with status LED
8. LAMP push button with status LED
9. DIM status button with status LED
10. Steering hat (inoperative)
11. Zoom control
12. Filter control
13. Crew select control (inoperative)

Overhead Panel:

HISL Switch: Lamp power

Collective Head:

S/L STEERING: 4-way steering

ORIENT CTRL: Orientation Control, between either S/L or HISL.

Currently inoperative.

HISL Steering in 4 directions can be accomplished also with the S/L steering events (see the controls setup section of this document)

Key features

- Filters
- Zoom
- Lens colors + IR
- 4-way steering

Action Pack - Hoist/Winch

The Hoist is available on the EMS, Firefighter and Offshore variants. It can be used within the context of a mission or it can be managed manually by the user. The Hoist is installed exclusively on the right side of the aircraft

Manual Hoisting

To manage the hoist manually.

1. Ensure the hoist is installed. **Tablet -> Aircraft -> Equipment**
2. Deploy the hoist, open the door and select an object.

Tablet -> Aircraft -> Cabin & Payload. On the top left of the page you may select all of the possible states for the hoist. Don't forget to open the door and select the operator to be positioned.

3. Control the hoist using the key bindings (available in ConfigTool) or by using the tablet without any new bindings. Click the top clock on the tablet, then select **Manual** under **Hoist Control**. You may now move the hoist up, down or pause it in place.

Note: The hoist will still automatically reel up when approaching the ground to avoid the object clipping through the terrain.

Automatic hoisting

1. Start the Rescue + Hospital Transfer (Use Anywhere) mission, or select other hoisting missions such as Road accident rescue.
2. Fly to a hoisting location of your choosing or fly to the target destination of the mission.
3. Select Begin Hoisting.
4. The crew will automatically operate the hoist as you pilot the aircraft.

Action Pack - Cargo Hook & Bambi Bucket

Cargo Hook

Use the H145M Weapons - Fire (Primary) key binding to toggle the attachment of the cargo hook to an object, and to detach from the object. To release an object you must be low enough for the hook to be unloaded (the object on the ground and no longer held by the cable). There is an icon at the top of the tablet to assist in the current status.

Enable the cargo hook option in the tablet, Aircraft app, Equipment page. You can set the object on the hook manually on the Crew & Payload page, however the object will not detach when set onto the ground.

Bambi Bucket

Attach the Bambi bucket to the firefighter variant by using the tablet Equipment page and selecting the Bambi and the Cargo Hook.

You may dump the bucket by using the H145M Weapons - Fire (Primary) key binding for activation. There is also a soft button in the tablet action center when applicable.

The DATA soft key on the VMS page will display the cargo hook status. The box will be empty when there is no weight on the hook and otherwise display the detected weight.

The bucket may be filled from any MSFS water source, or from dynamic objects designated as water sources. Two alternative water source objects are provided and may be placed with the Scenario Editor.

The bambi bucket can be controlled on the equipment page in the tablet aircraft app.

Hype Live Map

The [Live Map](#) presense may be configure on the tablet.

[Tablet](#) -> [Hype Online](#) (app). Only [Detailed](#) information will reveal callsign, which is to be entered at the MSFS World Map page, prior to starting the flight.

Terrain Warning System (HTAWS)

Helicopter Terrain Awareness System (HTAWS).

You may mute the aural warnings by selecting the overhead AUDIO/TAWS switch to STBY or MUTE.

You may also assign a binding in Hype Operations Center, to [HTAWS MUTE-FOR-5-MINS](#) , which is intended to be clicked shortly before landing.

AFCS (Autoflight System)

The H145 autopilot is a comprehensive autoflight system, capable of both basic stabilization and also fully-hands-off upper modes. The system combines redundant Stability Augmentation Systems with redundant aircraft management computers, which take data from aircraft sensors and send commands to the actuators. The systems are monitored by and interacted with through the MFDs, Autopilot control panel (APCP) and controls on the cyclic and collective.

Background

The H145 flight controls are augmented by parallel actuators, called SEMAs (smart electro-mechanical actuator). These parallel actuators are invisible to the pilot (not felt in the controls) and are controlled by aircraft computers directly. The SEMA are quick and powerful but limited in travel. The total SEMA travel will be only 10% of the pitch axis and 20% of the roll and yaw axis. For this reason, the AFCS also needs the ability to re-center the SEMA. The A.TRIM (auto trim) system is able to receive commands from the AFCS computers and then slowly drive the trim motor in the requested direction. As the trims move, the pilot sees and feels their cyclic moving. It is for this reason that the A.TRIM system must be engaged to use UPPER MODES, as otherwise the saturation of the SEMA could not be automatically resolved by the computers.

Community member Josh has created a detailed [H145 Autopilot explanation video](#) .

Trim Release

Trim Release (Cyclic Trim Release) is a button on the cyclic control which the pilot holds anytime they are manipulating the cyclic. This is a very important aspect of H145 and doing so both pauses the AFCS (so it doesn't fight you) and also gives you maximum precision. There is also a [Collective Trim Release](#) , but it isn't as necessary as the cyclic version.

Holding Trim Release is known as **Fly-Through Action**.

Follow-Up Trim

Follow-Up trim will allow you to manipulate the cyclic without using trim release, however this will only work well if you also have a very small H145 cyclic deadzone setting. Even still, Trim Release is recommended for all users. Note that Follow-Up trim is only enabled on ATT mode (and submodes). When follow-up trim is active, attitude setpoints will be updated for any deflection.

Follow-Up trim has 4 settings. The [Only Hover](#) option is considered the realistic setting, but [Off](#) is recommended for learning and understanding the systems.

Setting	Mode
Off	Follow-up trim is never active.
Only Hover	When below 30kias, follow-up trim is active.
Only Cruise	When above 30kias, follow-up trim is active.
Both	Follow-up trim is always active.

AFCS OFF and A.TRIM OFF Operation

Pilots are to fly with AFCS engaged during all normal operations. A.TRIM OFF is advised for sloped landings or with a heaving deck. Turning A.TRIM off ensures that the attitude change sensed does not result in flight control input that could injure those working around the aircraft.

AFCS and A.TRIM may be disengaged for training purposes at the pilots discretion.

ATT / Attitude Hold

Attitude hold mode (ATT) is the default autopilot mode and available independently on all 3 axis. Attitude hold mode provides long term attitude stabilization. This mode is also sometimes known as **basic autopilot**. As it is the default mode, it is **not** visualized on the AFCS Status Strip.

Engagement: ATT is engaged automatically when at least one SAS is available and no other mode is selected. It is automatically engaged when disengaging any upper mode.

Reference Management: Use [Cyclic Trim Release](#) or [Cyclic Beep Trim](#) to change pitch and roll attitude.

Fly-Through Action: Hold new attitude.

* - ATT mode turn coordination is inoperative.

DSAS / Digital SAS

DSAS mode is actually a degraded sub-mode of ATT. It is engaged automatically on any axis when the A.TRIM function is inoperative. The mode provides short term attitude stabilization, however long term stabilization is not assured due to lack of auto trim.

Engagement: **A.TRIM** Toggle or automatically due to trim failure.

Reference Management:

- Use **Cyclic Trim Release** or **Cyclic Beep Trim** to change pitch and roll attitude.
- Use **Collective Beep Trim Left/Right** to trim the yaw pedals. Fly-Through Action: Hold new attitude.

HDG and TRK / Heading Hold

Heading hold mode will use yaw in low speed (less than 30kt) and roll and yaw at higher speeds. Track mode will use a GPS ground track. Use the APCP butterfly knob to change to TRK.

Engagement: **HDG** Toggle on the APCP.

Reference Management: **Cyclic Beep Trim Left/Right** will change heading reference.

Fly-Through Action: Return to selected heading.

VS and FPA / Vertical Speed

VS mode will acquire and maintain a vertical speed. FPA (flight path angle) will use a GPS ground reference. Use the APCP butterfly knob to change to FPA.

Engagement: **VS** Toggle on the APCP.

Reference Management: **Collective Beep Trim Up/Down** will change heading reference.

Fly-Through Action: Return to selected VS.

ALT / Altitude Hold

ALT mode will maintain the altitude at engagement.

Engagement: **ALT** Toggle on the APCP.

Reference Management: **Collective Beep Trim Up/Down** will change altitude reference.

Fly-Through Action: Return to selected altitude.

ALT.A / Altitude Acquire

ALT.A mode will use VS mode to acquire and maintain an altitude. Change the ALT.A reference on the APCP, then engage the ALT.A by pushing the knob.

Engagement: **ALT.A** Toggle on the APCP.

Reference Management: **Collective Beep Trim Up/Down** will change altitude reference.

Fly-Through Action: Return to selected altitude.

IAS / Indicated Airspeed Hold

IAS mode will acquire and maintain an selected airspeed.

Engagement: **IAS** Toggle on the APCP.

Reference Management: **Cyclic Beep Trim Up/Down** will change airspeed reference.

Fly-Through Action: Return to selected airspeed.

GA / Go-Around

GA mode will act similarly to IAS and VS. It executes for 15 seconds in cruise and 25 seconds from a hover.

Engagement: **Collective GA** press.

Reference Management:

- Cyclic Beep Trim Up/Down** will change airspeed reference.
- Collective Beep Trim Up/Down** will change the VS reference. Fly-Through Action: Return to selected airspeed and VS.

GTC / Ground Trajectory Command

GTC mode will maintain current ground-referenced speeds on longitudinal and lateral axis, as well as heading hold on the yaw axis.

Engagement: GTC press once.

Reference Management:

Cyclic Beep Trim Up/Down will change Vy reference.

Cyclic Beep Trim Left/Right will change Vx reference. Fly-Through Action: Update Vy and Vx references.

GTC.H / Auto Hover

GTC.H is a sub-mode of GTC and will acquire and maintain a fixed ground-referenced position.

Engagement: GTC press twice.

Reference Management:

Cyclic Beep Trim Up/Down will change the longitudinal position by approximately 1 meter.

Cyclic Beep Trim Left/Right will change the lateral position by approximately 1 meter. Fly-Through

Action: Update to new position.

VOR / VOR Navigation

LOC mode will track a localizer in order to conduct an instrument landing.

Engagement: CPL key on FND, NAVD or DMAP page.

Reference Management: CRS key may be available (note: MSFS may still restrict changing LOC course), on NAVD or FND pages.

Fly-Through Action: Return to tracking LOC.

LOC / Localizer

LOC mode will track a localizer in order to conduct an instrument landing.

Engagement: CPL key on FND, NAVD or DMAP page.

Reference Management: CRS key may be available (note: MSFS may still restrict changing LOC course), on NAVD or FND pages.

Fly-Through Action: Return to tracking LOC.

NAV / FMS Navigation

NAV mode will track a FMS navigation source.

Engagement: CPL key on FND, NAVD or DMAP page.

Reference Management: None. Use FMS to change flight plan.

Fly-Through Action: Return to tracking FMS.

GS / Localizer Glideslope

GS mode will track a localizer glideslope in order to conduct an instrument landing.

Engagement: CPL key on FND, NAVD or DMAP page.

Reference Management: None.

Fly-Through Action: Return to tracking GS.

APP / Approach

APP mode will track an approach in order to conduct an GPS procedure landing.

Engagement: CPL key on FND, NAVD or DMAP page.

Reference Management: None.

Fly-Through Action: Return to tracking APP.

V.APP / Vertical Approach

V.APP mode will track a glidepath in order to conduct an GPS procedure landing.

Engagement: CPL key on FND, NAVD or DMAP page.

Reference Management: None.

Fly-Through Action: Return to tracking G/P.

Missions

The H145 includes built-in missions which run in the H145 without the use of any external programs. The [Hype mission platform](#) is available for new types of missions to be created. The mission script is a powerful language to interact with H145, data queries powered by OpenStreetMap, and the rest of MSFS. Third party packs are available with objects, missions and mission templates.

There are also multiplayer online missions where multiple users join a session and have a shared mission script which can orchestrate events, games and challenges.

There is also a tool called Scenario Editor where you may build your own simple missions using a graphical editor. This tool is available in Hype Operations Center.

Information for all missions

- When you arrive at a location, don't forget to place both engines to IDLE power. This is the cue that is used for the mission to proceed (crew to exit, etc.)
- Completed Missions are optionally logged and visible in Hype Operations Center on the Completed Missions page.
-

Mission App Settings

These settings are available under the gear icon and persist with each H145 variant.

Mission map update rate	Low (Performance), High This will control how often the map updates and may or may not help performance generally
Mission map resolution	Low (Performance, High The map will have larger but more blurry text and better fps on the Low setting, but will have crisper text and a higher resolution on the High setting.
Mission Flares	Higher Visibility, Realistic (No Smoke) Realistic version will only show smoke for actual marine or mountain rescue. This is configurable from the object by the mission author.
Mission Entry Markers	High Visibility, Map Icon Only Show blue mission entry markers at the site of the location marked on the mission map.
Mission Fire Quality	Low (Performance), High High quality fire has substantially more smoke. May impact fps especially for very large fires. High quality fire requires Top Gun Maverick DLC to be installed in MSFS.
Data Query Service	Overpass DE Mail.RU Kumi OSM RU Overpass API choices are driven by <code>MissionSystem.json</code> . Previously Mail.RU was very very fast but now we have changed the default to Overpass DE which is reliable but slower.

Adding Mission Packs / Developing Missions

The mission library will show all available missions which do not have a natural start point on the map. Once selected they will show as highlighted to indicate they are active.

REFRESH: Reloads the mission index from disk and then the default mission visualizes all start locations on the map and allows entry into the missions. This will also clear any in progress mission.

Adding mission packs

1. Install one or more mission packs to your Community folder, like any other livery or scenery add-on. You install mission packs in their own folder, not into the H145 folders.
2. Run `Community\hpg-airbus-h145\Tools\Update Mission Index.cmd`. This will scan for all missions within your Community folder, and save them to a file that H145 can read. You can run this script at any time. Alternatively Scenario Editor has a button **Update Mission Index** which is the same function.
3. If the sim is already running, open the mission catalog and press **REFRESH** to reload missions from disk.

Updating the mission index

The mission index is stored in the H145 aircraft folders, so it needs to be updated with the content of all the missions that you have installed into your Community folder.

To update the mission index, run `Community\hpg-airbus-h145\Tools\Update Mission Index.cmd`. This will scan for all missions within your Community folder, and save them to a file that H145 can read. Alternatively Scenario Editor has a button **Update Mission Index** which is the same function.

You can run this script at any time, whether the simulator is open or not. If the simulator is open, you'll need to press **Refresh** in the Missions app under the Library tab.

Note: You will also need to update the mission index after each new H145 build is installed.

Developing custom missions

Use the Scenario Editor to begin with mission development. Check the H145 Mission System Documentation included with the Action Pack download. There is a sample object as well as the complete API reference for the mission system commands. Scenario Editor is suitable for all users, editing the exported code is something more advanced that only some will do.

Scenario Editor App

Download the Scenario Editor installer from the H145 download center. Install the program and it will create a shortcut on your Windows Start menu. You may discard the installer after it opens the program.

Settings page

You must set your Community location. MS Store and Steam installations will be automatically detected, but you may need to select a folder manually or pick for a dual installation.

H145 aircraft page

H145 base pack and action pack are detected from your Community folder. If you have an `hpg-airbus-h145` and `hpg-airbus-h145-ap` folder within your selected Community folder they will be shown here with the related tools. Note that you **must not rename the folders** right now or they won't be detected.

Verify Download will check the integrity of the files within your H145 installation.

Open ConfigTool will launch ConfigTool.

Update Mission Index will update your mission index within H145, enabling mission packs to be read by H145 directly. You should do this each time you add or remove a mission pack from your Community folder, or when you export one of your own missions. The sim may be running but you must select **Refresh** within the Library in the Mission app on the H145 tablet to actually reload the updated index.

Hype Online page

Hype Online displays your past mission results. Click an item to see that specific mission, or all previously recorded missions will be displayed.

You will be asked at the end of compatible missions if you would like to log the results.

Scenario Editor Dashboard page

My Scenarios

All the scenarios which you have worked on are presented here for you to open them and begin work again.

Create new Scenarios

All the installed scenario templates are presented here, enabling you to create a new scenario from an existing template. Scenario templates (.scenariometa files) are loaded from the Community folder. Your scenarios are stored at %appdata%\Hype Aircraft\User Scenarios

Scenario Developer

At the bottom of the list is the advanced Scenario Developer tool which lets you quickly send mission code to the sim. This is the most complicated way to build scenarios and scenario templates but also the most powerful.

Scenario Editor

The Scenario Editor is a graphical tool that enables configuring your scenario. The key idea is to use tools from the toolbar to configure objects and zones for the mission.

Mission objects and zones are displayed on the right side when in edit mode. Click the header to center the map on that object or zone. Select the relevant options to configure the objects' appearance, behavior or the behavior of the zone that will be used for the mission.

Once you can see the Scenario Editor map **and have selected Save Changes at least once**, you are ready to connect from the H145. Using the H145 tablet mission app, visit the Library and select **Connect to Scenario Editor on my PC**. Your aircraft will be listed under Connected Aircraft and you will see a helicopter icon somewhere in the world.

Hype Operations Center - Scenario Editor		
Home	Scenario Planner	Connected Aircraft
Address	Aircraft	Livery
ffff:127.0.0.1	D-HYPE (H145/EMS Ver. DEV)	Airbus H145 CMH

Export your missions

When you are finished with a mission and want to test it without needing Scenario Editor or to share with others, select **Export for MSFS**. Choose a location like `Community\my-cool-missions\hpgmission`. (That is to say, make a new folder under Community, then an hpgmission folder within that, and place your mission json within that hpgmission folder). Then, run **Update Mission Index** either by the script in the tools folder or by using the H145 page of Scenario Editor. Once you export a mission, you can use it without using the Scenario Editor app.

Scenario Editor Workflows

Note that Scenario Editor has two modes of operation. The first mode is where you Connect from H145, and are forced into the mission you are developing. The second mode is where you export, Update Mission Index and then are able to load missions without using Scenario Editor. This is what enables end users to avoid installing Scenario Editor at all if they do not prefer it. Scenario Editor is also required for Multiplayer firefighting.

Multiplayer Missions

Only the static fire fighting scenario may be conducted with multiple players.

NOTE: OPENING PORTS TO THE INTERNET POSES A SECURITY RISK. CHANGES TO YOUR FIREWALL SHOULD BE CONDUCTED WITH KNOWLEDGE OF NETWORK SECURITY.

To begin a multiplayer firefighting session:

1. Identify your public IP address. Make a copy of the file in `hpg-airbus-h145\hpgmission\Scenario Editor Server.json`. Edit the file and replace localhost with your public IP address, and to change the title to `My Server`. Name the file `My Server.json`.
2. Share `My Server.json` to your friends and instruct them to place it into the `hpg-airbus-h145\hpgmission\` folder and then run **Update Mission Index**.

3. Configure your firewall to allow port 40510 to be routed to your PC. This may require both editing the firewall on your router and also the Windows firewall.
4. Start Scenario Editor and load a firefighting mission.
5. Invite other players to load their H145s at the desired location, and to select **My Server** from the mission app on the Library page.
6. Players should be visible on the map and in the aircraft list in Scenario Editor

Scenario Templates

Using Scenario Editor you may build custom scenarios with your own object placements and location choices.

Templates that use “zones” are randomly picking between like zones and data query results in those zones. The point is that you can define an area of POIs or an area that should get random locations, and this way you can create missions for a region which are randomized but still keep you within the defined area and using only the defined locations.

Templates that are “custom” are usually a single mission but everything can be defined, including placing objects at the (e.g.) accident site.

Base Pack - Luxury/Civilian

Passenger Transport

This is a very simple mission where you select a source and destination helipad and fly a leg between them.

Base Pack - Military

Crew Movement

This mission simply sends soldiers running to or from the helicopter.

Action Pack - Medical

Road Accident

Select the range for the accident, then accept the dispatch or cycle to another location.

Fly to the accident site. Either land or use hoisting if needed. After securing the patient, you'll select a nearby hospital.

Fly to the hospital and unload the patient.

Hospital Patient Transfer

Start at a hospital (or at a suitable location to load a patient, like an airport ramp).

The patient will be loaded and you will choose the hospital destination on the map.

Fly to the hospital, land at the designated site or find a suitable nearby landing site.

Aerosoft Offshore Landmarks: North Sea - Medevac

[REQUIRED: 'Aerosoft Offshore Landmarks: North Sea'](#)

There are 3 included missions (for the three main types of POIs: Ships, Platforms and Wind farm substations).

Each mission works the same. You may start up to 80nm away, and a random dispatch will be assigned (with the option to cycle the location).

Fly to the platform, land and secure the patient.

Select a nearby hospital from the mission map (it may be very far away)

Fly to the hospital and unload the patient.

HEMS Mission Generator

[Check out this awesome third party mission generator](#) .

Action Pack - Firefighter

Nearby Woodland fire

You'll be dispatched to extinguish several small fires nearby. Use your bambi bucket and find a water source.

NOTE: If you land you will be able to spawn (request) a portable water source (firefighting pool) for your use.

Firefighting – Start Fire (Anywhere)

Synopsis

In this mission you and a group of friends may fight one or more constantly evolving fires.

Wildfires are a serious threat to lives, property, and the environment. They can spread rapidly and unpredictably, fueled by dry vegetation, strong winds, and human activity. To combat these fires, aerial firefighting is a vital and effective strategy that involves dropping water, or fire retardants from various fixed and rotary-wing aircraft..

Helicopters are especially well suited for aerial firefighting, as they can maneuver in tight spaces, hover over hot spots, and access remote areas. They can also use a variety of tools, such as the bambi bucket, a collapsible container that can scoop water from lakes or rivers, or the heli-torch, a device that can ignite controlled fires to create firebreaks. Helicopters can also work in coordination with ground crews, providing them with air support, reconnaissance, and transportation.

Mission Key Features:

- 1. Firefighting with realistic fire spread dynamics based on wind and terrain
- 2. Single player or multi-player online
- 3. Bambi Bucket firefighting or Heli-Torch operations to proactively reduce fuel on the ground
- 4. Ground Crews that inhibit fire spreading in their area of influence

Requirements

Type	Download
Aircraft	1. H145 Base Pack and
Required	2. H145 Action Pack
	Minimum Version Required: H145 Build 435.

Installation

Install H145 and H145 Action Pack. [Follow the instructions here](#)

```
Community\  
  
hpg-airbus-h145  
  
hpg-airbus-h145-ap
```

Setup

This mission is pre-installed and does not require any mission files to be installed.
You need to prepare a binding on your controller for **TOGGLE YAW DAMPER**. This key will be used in two ways:

- 1. **Click**: When you are over land and the cargo object is touching the ground, **clicking** will attach or detach the object.
- 2. **Hold**: When you are in the air or over water, **holding down** the button will open the valve and release the water or diesel.

Start the missions

Fly this mission using the **Firefighter** variant of H145.

- 1. Select the Missions app on the tablet.
- 2. Select the Library section of the mission app. If you have a mission already in progress, you'll see a red Abort Mission button instead of

the library.

3. Aborting the mission will go back to the library. Navigate into the **HPG Missions Firefighter** folder
4. Select the **Start Fire Here v2.x** mission.

You'll now see the mission setup

Choose Online or Offline game play

After you launch the mission you will need to decide if you want to play offline or if you will connect to the server and use a room there. Offline game play is single player only.

You can create and manage rooms at any time, by visiting [Hype Multiplayer Management](#)

When you choose to play online:

- **UserName:** This is arbitrary and used as a friendly name to identify yourself. Defaults to your MSFS ATC call sign.
- **Room:** This is the room name selected when creating a room.
- **Password:** This is selected in the **Security** area of the management website.

Choose to become the mission host or continue as a player

One player must become the host. The host aircraft will conduct fire spreading calculations and manage the fires. **The host must not disconnect or abort the mission.**

- **Become Mission Host:** You will become the host and have access to fire controls
- **Wait for Host (I am a Player):** You will still need to wait for the host to join

NOTE: When playing offline you will not be asked as you must always be the host when playing alone.

Choose your firefighting attachment

Now that you have set the mission up, you may land your aircraft and choose to attach the bambi bucket or heli-torch.

The object will appear in front of your aircraft after selecting the option in the mission.

Start a fire

The fire isn't started yet, you won't see any fire icons on the tablet or DMAP just yet. You can start a fire multiple ways:

- 1. Using the web client, click on the map and then click **Start a fire**.
- 2. Using the aircraft, click on the map and then click **Start fire**
- 3. Using the aircraft heli-torch, hold down **TOGGLE YAW DAMPER** to start new fires. It's best to use ground crews to manage these fires instead of allowing them to spread.

Flight the fires

Once you've attached the bambi bucket, you're ready to hover over a water source and fill up. Fill up your bucket:

- 1. Enter a hover and slowly descend to about 20 feet
- 2. You'll see the bucket start to fill a) on the tablet notification bar and b) on the VMS:DATA display on the MFD.
- 3. If you are too heavy, you can bleed off water by holding down the **TOGGLE YAW DAMPER** button to bleed off some water. It's recommended to use no more than 30% fuel while doing bambi operations.

Now you may fly over the fire (don't get too close as it can damage your aircraft) and hold down **TOGGLE YAW DAMPER** for the entire time you want to drop. You can hold down the button just long enough and reserve water to drop again.

Managing the mission

Using the web client you may manage the mission by establishing and removing ground crews, monitoring activity and creating more fires.

Cargo - Heli Logging Revelstoke

Synopsis

In your mission, you will be flying to various locations related to logging activities, including the logging decks and the processing mill, to deliver tools & supplies and move logs down to the mill. This will require precision flying and landing skills, as well as the ability to navigate through challenging terrain.

Helicopters are often used for logging operations because they can access remote areas that are difficult to reach by road or other means of transportation. They can also transport heavy loads of logs and supplies to and from the logging sites with ease.

Revelstoke is a city in southeastern British Columbia, Canada, located 641 kilometers east of Vancouver and 415 kilometers west of Calgary, Alberta. It is situated on the banks of the Columbia River, just south of the Revelstoke Dam and near its confluence with the Illecillewaet River. The area is known for its natural beauty, with the Monashee and Selkirk Mountain Ranges surrounding it.

Mission Key Features:

1. **Tool Delivery:** Deliver supplies & tools to logging deck helipads.
2. **Logging Transport:** Retrieve Logs from the logging sites and return them to the mill.
3. Mission Tasking responsive to scenery detection. If you don't have the Lakeview expansion installed, then you won't be tasked to area.
4. Single player offline & Multiplayer online. Leaderboards and moving map available on the web.

Requirements

Type	Download
Aircraft Required	1. H145 Base Pack and 2. H145 Action Pack Minimum Version Required: H145 Build 435 .
Mission Required	Heli Logging Revelstoke by BlueEcko
Scenery Required	Heli Logging Revelstoke BC, CA by WingBoss
Scenery Optional (Recommended)	Heli Logging Revelstoke BC, CA - Lake View Addition by WingBoss
Scenery Optional (Recommended)	Glacier Helicopters Base - Revelstoke BC, CA by WingBoss

Installation

1. Install H145 and H145 Action Pack. [Follow the instructions here](#)

```
Community\
  hpg-airbus-h145
  hpg-airbus-h145-ap
```

2. Download the scenery (as well as the dependencies) and place them into your Community folder.

```
Community\  
  
revelstoke-lakeview-scenery  
revelstoke-logging1-scenery  
revelstoke-mill1-scenery  
revelstoke-glacierhp-scenery  
wookie042-bush-and-backcountry-library  
human-library-animatd  
esd-modellib-eolib
```

3. Download the mission and place the folder into your Community folder.

```
Community\  
  
hpg-airbus-h145-z-blueecko-missions
```

4. You must now update the aircraft mission index This can be done using one of two methods:

Method 1:

1. Open Hype Operations Center
2. Visit the H145 aircraft page
3. On the **Indexed Missions** section, select **Update**.
4. The mission will now be visible in the list below.
5. If your aircraft is currently running, you must **Refresh** the mission index by visiting **Tablet -> Aircraft -> Missions -> Library** and selecting **Refresh**.

Method 2:

1. Run the script at **Community\hpg-airbus-h145\Tools\Upate Mission Index.cmd**
2. The mission file will be mentioned in the list and you will see a success indication at the bottom of the window. You may close the window.
3. If your aircraft is currently running, you must **Refresh** the mission index by visiting **Tablet -> Aircraft -> Missions -> Library** and selecting **Refresh**

Setup

You need to prepare a binding on your controller for TOGGLE YAW DAMPER:

- **Click**: Clicking the button will attach or detach the cargo object, when you are in range of the object. Check the tablet status bar for confirmation

Start the mission

Fly this mission using the **Cargo** variant (**Civil Cargo** or **Military Cargo**) of H145. You may spawn at the mill or perhaps at the nearby Revelstoke Airport (CYRV).

1. Select the **Missions** app on the tablet.
2. Select the Library section of the mission app. If you have a mission already in progress, you'll see a red Abort Mission button instead of the library. Aborting the mission will go back to the library.
3. Navigate into the **HPG Missions BlueEcko** folder
4. Select the **Heli Logging Revelstoke x.x.x** mission.

Mission Setup

After you launch the mission you will see the following screen. The dynamic scenery detection will show **Not Installed** if you don't have the required scenery, and will check for the add-on lakeview scenery and enable additional sites if it's detected.

NOTE: If you follow the link, download and install the scenery your sim will need to be restarted for it to detect and load the scenery properly.

Once Checks are complete, you will need to decide if you want to play offline or if you will connect to the server and use a room there. Offline game play is single player only.

You can create and manage rooms at any time, by visiting [Hype Multiplayer Management](#).

When you choose to play online:

UserName: This is arbitrary and used as a friendly name to identify yourself. Defaults to your MSFS ATC call sign.

- **Room:** This is the room name selected when creating a room.
- **Password:** This is selected in the **Security** area of the management website.

Room Configuration

The Room Password is used by players connecting from the aircraft cockpit.
The Operator password is used by you to manage the room on this website.

Room Name:

Room Password:

Operator Password:

Update Passwords

Proceeding with the mission

You'll need to select either **Offline (Single Player)** or **Online (Multiplayer)** and then mission tasking will automatically begin.

You should configure your helicopter before flight, you will want to assure "Remote Hook" is enabled and set your fuel accordingly. The Huge Logs Bundle is heavy, and you will not be able to lift with fuel weights too high. I recommend 25%.

Follow your track line to the cargo and complete your first run! After the cargo is released you will have one point added to your score and a new task will be randomly generated.

Now get to work. They're waiting for you.

HEMS – Random Rescue Missions (Anywhere)

Download

[HPG Airbus H145 Action pack: HEMS Random and Anywhere mission](#)

Action Pack - Offshore

Nearby water rescue

This mission can be started from the library and will create a random location off the coast (assuming you are close enough to any coastline).
You fly to the location to find either a sinking boat or a crashed airplane with life raft.
Rescue by hoist the survivor(s) (there will be 1 or 2). Deliver them to a nearby airport.

Action Pack – Cargo

Pick up Sling Cargo Here

This mission enables you to pick a source and destination location, and transfer 4 packages using your sling capability.
Start the mission on the mission map, by selecting the pick-up location and then entering the mission. You'll be immediately asked to set the destination location on the map.
After accepting the destination, the packages will appear at the pick-up location.
Move the packages to the destination. Use the TOGGLE YAW DAMPER (Primary Action) to connect and disconnect from the sling cargo.

Multiplayer

Earthquake! 2.0

The Earthquake mission is a combined multiplayer activity. Rounds are 6 hours long. One player joins the mission and clicks "Setup". This loads random locations and saves them for the round.

All players connect, join the same MSFS multiplayer server, and then are able to see the same smoke/fire, EMS incidents, and electrical substations needing hardware.

The mission briefing explains the POI types. POIs will be shown with a green checkmark when completed.

Three variants are supported:

- Firefighter - Your job is to put out the various woodland fires around the city
- Medical - Your job is to rescue people from various accidents around the city
- Civilian Cargo - Your job is to deliver sling cargo to electrical substations, enabling repair of the electrical network in the city

After 6 hours the round will close, and all players must disconnect. Upon reconnecting, Setup may be run by one player and another round may begin immediately.

Livery Author Info

This section is for those who make aircraft paints (liveries). Many liveries are available already at <https://flightsim.to/c/liveries/airbus-h145/>. Please do share your liveries with the community.

Paint Kit

fallback.4=...\hpg-airbus-h145-civ\texture
fallback.5=...\hpg-airbus-h145\texture
```

Controlling External Parts

In order to control the parts for your livery, you must include a new file within your livery package named `Livery\<Title>.json`. Change only **<Title>** to match your aircraft. The **<Title>** comes from your `aircraft.cfg`, `fltsim.0 title=<Title>` line. For example the built-in package uses a configuration for the livery matching the title **Airbus H145 Civilian Livery 2**.

Sample Configuration

```
{
  "Commands": [
    {"Name": "H145_WSPS_Top", "Value": 1},
    {"Name": "H145_WSPS_Bottom", "Value": 1},
    {"Name": "H145_WSPS_Skids", "Value": 1},
    {"Name": "H145_SkidSettlingPreventers", "Value": 1},
    {"Name": "H145_Radome", "Value": 1}
  ],
  "CrewTitle": "Airbus H145 Example Crew"
}
```

NOTE: Invalid JSON will be rejected. Use [JSON Validator](#) to check your file

Command	Values	Notes
H145_WSPS_Top H145_WSPS_Bottom H145_WSPS_Skids	0 or 1	Wire Strike Protection system options. Bottom WSPS not available on Military variant.
H145_SkidSettlingPreventers	0 or 1	Skid-settling-preventers presence. Not compatible with skid snow skis.
H145_SkidStrutCaps	0 or 1	Skid struct covers near cockpit door
H145_SECOND_LANDING_LIGHT	0 or 1	Add a second fixed LDG light
H145_ROTOR_BLUR_STRIPES	0 or 1	Turn on rotor visuals with a split top and bottom texture, better for rotor designs where the top has stripes but the bottom is black.
H145_Radome	0: none 1: small 2: large	Weather Radar and Radome presence. Large radome on HEMS, Firefighter, Offshore, Civil Cargo variants only.
H145_RocketPods	0 or 1	External Weapon Pods installed Military variant only.

H145_WeaponSight	0 or 1	Cockpit Alignment optics installed Military variant only.
H145_CHIN_WINDOW_PLATES	0 or 1	Chin window plates installed instead of glass. Civil, HEMS, Firefighter, Offshore, Civil Cargo variants only.
H145_HOIST	0 or 1	Hoist installed HEMS, Firefighter, Offshore variants only.
H145_ELT	0 or 1	ADELTA installed HEMS, Firefighter, Offshore, Civil Cargo variants only.
H145_SNOWSKI	0 or 1	Snow Skis installed. Not compatible with floats Not compatible with skid settling preventers HEMS, Firefighter, Civil Cargo variants only.
H145_HISL	0 or 1	High Intensity Search Light installed HEMS, Firefighter, Offshore, Civil Cargo variants only.
H145_FLOATS	0 or 1	Emergency Floats installed HEMS, Firefighter, Civil Cargo variant only.
H145_LONG_SKID	0 or 1	Long Skids installed (implicit with floats). HEMS, Firefighter, Civil Cargo variant only.
H145_CARGO_HOOK	0 or 1	Cargo Hook installed. Firefighter, Offshore, Civil Cargo, Military Cargo variants only.

Configuring external crew

To set the crew models which appear detached from the helicopter, you can use the CrewTitle token to select any of the default crews that come with H145.

Action Pack only.

Title	Description
Airbus H145 ADAC Crew	ADAC style
Airbus H145 DRF Crew	DRF style
Airbus H145 CMH Crew	Generic red style
Airbus H145 Norsk Luftambulans Crew Airbus H145 HeliOtago Crew Airbus H145 Bundeswehr Crew	Generic orange style
Airbus H145 CAL FIRE Crew	CAL FIRE style

Custom external crew

If you paint the crew models you must include a second aircraft.cfg which points to the crew base container. The second aircraft.cfg is based on hpg-airbus-h145-crew and should have a texture.cfg which points to your aircraft main livery texture folder. There is no need to duplicate any textures, you will simply add one more aircraft.cfg and texture.cfg to your livery package. The CrewTitle should then be set to your crew livery name, which is recommended to be in the form of `YourLiveryTitle Crew`

Setting Tablet Wallpaper

Include a **wallpaper.jpg** file in your package: `html_ui\Livery\<Title>\wallpaper.jpg`

Adding documents to the Documents app

Your livery may add documents to the Documents app. They will be merged in with the documents provided by the system and the user.

1. See the Documents app section for how to generate user documents.
2. Move everything (including Index.json) in: `hpg-airbus-h145-userdocs\html_ui\HPGH145-User\Documents`
To: `<your livery>\html_ui\HPGH145-User\LiveryDocuments\<livery title>`

Download and Install H145

Download & Install

Install either H145 or H160 using this guide.

1. Download and install [Hype Operations Center](#).
2. Open Hype Operations Center from your Start menu.
3. Visit the product page (either H145 or H160) for the aircraft you'd like to install.

4. Click to select the Community path.

5. Select your Community location. The item must show as highlighted in blue. You may select a custom path for use with Addon Linker, or if the automatic detection is not correct.

6. Select your aircraft from the side menu again.

7. Confirm the Community location is correct, and then click Manage Installation.

8. Enter your Base Pack license key. You will have been emailed this from Hype Performance Group Downloads. [Help me find my details!](#)

Base Pack

License Key:

Add

9. Copy & Paste your license key into the box. The green ADD button will be available only when the correct length key is entered. Check for extra spaces before or after the key, if you have trouble.

13. Check for installation success. You are ready to fly.

Installed Version

Community Location: J:\Packages\Community

Package	Version	Status
Base Pack	hpg-airbus-h160	Installed (Build 43) ✓
Action Pack	hpg-airbus-h160-ap	Not Detected

Remove All Installed Packages

Finished - Success ✓

How to Install Action Pack

To install Action Pack, follow these steps:

1. Add the Action Pack license key (use steps 8-10 from the procedure above)
2. After the Action Pack key is saved, select **Remove all installed packages**
3. Select **Install** on a version from the available versions list

Now Action Pack will be downloaded and installed along with a matched version of the Base Pack

After Installation

- Upgrading to a new version does not require uninstall, however rolling back to an earlier version does.
- To use an older version, click Remove all packages and then Install. You may need to reveal all versions by selecting Show Hidden Versions

Download Cache

ZIP files are cached to %appdata%\Hype Aircraft\Downloads. You may clear this directory as needed and the large files will be re-downloaded, however this may be slow. You may also junction this location to another drive if needed.

Products are composed of a main package (large) and an update package (much smaller). Keeping the main package will allow you to avoid any extra download time when changing builds (specifically rolling back or reinstalling).

Use of Addon Linker

Use of the third party program Addon Linker is supported: you should place all of your HPG addons into one folder somewhere, and then point Hype Operations Center to that folder as if it was your Community location. Then link in your content as normally in addon linker.

Note that Hype Operations Center assumes it can find content like mission packs by navigating to other folders in your selected Community Location. For this reason you should place HPG addons, mission packs and object packs into one combined location so that Hype Operations Center sees it as a 'normal Community folder'.

Activation trouble

Activation is on Microsoft Azure and highly reliable. If you have trouble activating in the cockpit, check these items (the most likely listed first):

- Check that **Online Functionality** is enabled in MSFS DATA Settings
- Ensure that your PC Date, Time and Timezone are accurate. Go into PC Settings to update your PC time. **Set time automatically** is highly recommended.
- Check your firewall. You must be able to access [This URL \(opens new window\)](#). You should see **Not Authorized**.
- Reinstall the aircraft to ensure that you don't have a corrupt copy installed.
- Remove all other addons from your Community folder
- Remove addons from exe.xml

Troubleshooting**Microsoft Teams or other app won't install**

The Squirrel installer has [a bug](#) where it can confuse itself with stale data. You may see Microsoft Teams by Hype Performance Group.

Resolution:

1. Open `%LocalAppData%\SquirrelTemp` in the File Explorer address bar.
2. Delete SquirrelTemp folder.
3. Attempt installation again (of Hype Operations Center or another Squirrel installer).

Known Issues

Issue	Workaround
Error: path is not absolute	Community Location was not properly set, re-select the Community Location and try again
Error: end of central directory index	Visit Settings -> Download Cache Location. Delete the small zip file (13kb or so) and try again

We are working to remove known issues and above will all be fixed in a subsequent update.

- You also should find your info in your account after logging in at [Hype Performance Group Store](#)

MFD screens are black or the tablet won't open

This almost always means the installation is corrupt or there is an addon conflict.

Resolution:

1. In Hype Operations Center, select [Removes All Packages](#).
2. Select [Install](#) on the latest version of the product.
3. If the aircraft is still not working, **remove all other addons from Community folder**.

GTN750 screens are black

If the GTN750 screens are black then use the tablet to ensure the setting is as desired. Make sure to remove old H145 packages which enabled GTN750 options, as this setting is now built-in.

Resolution:

1. [H145 Tablet](#) -> [Aircraft](#) (app) -> [Options](#) (page). Change [GTN750 Software](#) to either [pms50](#) or [TDSSim](#).
2. If the GTN750 remains blank, reinstall the vendor software module and try again.
3. If the GTN750 remains black, **remove all other addons from Community folder**.

It feels like I am fighting the aircraft when I fly.

You need to use [Cyclic Trim Release](#), this removes the deadzone and also pauses the AFCS so it will not compete with you.

The aircraft is not reliable when flying with autopilot upper modes (HDG, IAS, ALT)

Ensure that your [Cyclic Deadzone](#) is large enough. You must not have accidental HANDS ON input as this will compromise the autopilot.

Click-spots in the virtual cockpit are offset

Lens Correct will distort the view and break clicking on controls.

Resolution:

1. Turn off the MSFS [Lens Correction](#) setting.

The camera moves in an erratic way, mostly when taking off and landing.

Something is wrong with the [Camera Shake](#) setting, it needs to be cycled to fix it.

Resolution:

1. Turn On MSFS [Camera Shake](#). Apply.
2. Turn Off MSFS [Camera Shake](#). Apply.

I have bound a hotkey but it always sends multiple commands

MSFS Bindings have the option for "On Press" and "On Release". By default, keys will repeat after some short delay.

Resolution:

1. Go into MSFS Control settings and change the binding to **On Release**.

Aircraft has pink textures

- A. A common problem is to install only the [Action Pack](#). You must also install the [H145 Base Pack](#).
- B. Very old civil variant liveries need a [texture.cfg](#) update since they were not authored with one initially:

```
[fltsim]
fallback.1=..\..\hpg-airbus-h145-civ\texture
fallback.2=..\..\hpg-airbus-h145\texture
```

- C. If you are a livery author, check the user guide for [texture.cfg](#) configuration for the variant you are painting.

MGB Over limit / Aircraft won't takeoff

These warnings indicate aircraft damage. This our new detailed damage model in action.

- 1. On the tablet, use the Failures & Maintenance app , and clear the damage by clicking Do All Maintenance .
- 2. (optional) turn Aircraft Damage to OFF in the Aircraft app on the Setup page.

Unable to start at MSFS Helipads

Liveries authored before Sim Update 11 (Nov 2022) will need to be updated in order to avoid preventing H145 from starting at helipads.

Resolution:

- 1. Locate the aircraft.cfg file within the livery package (if you find two, update both)
- 2. Change ui_typerole="Helicopter" to ui_typerole="Rotorcraft" .

The built-in H145 liveries are up to date, as of build 360. If you are still using Version 1.0, you would also need to make this change to the base liveries.

Known Issues

WTT Mode is inoperative with helicopters in MSFS

Due to [this bug](#), we are unable to provide a WTT package for H145.

FSRealistic Low-altitude turbulence is not compatible with helicopters.

FSRealistic software has a mode `Low-altitude turbulence` that will cause problems with the flight model. Turn it off.

Tablet Time option is off by 1 hour

Reading the time is often wrong due to the [sim DST database being out of date](#) .

Helicopters don't spawn correctly on some helipads

The position of the helicopter may be forward or aft of the correct position. [Asobo knows about the problem](#) .

Helicopter ground effect transition is abrupt when approaching elevated helipads

[Asobo has confirmed the bug](#) and indicated a fix will come in a future version of MSFS.

Acronym List

Acronym	Meaning
ACAS	Airborne Collision Avoidance System
ACOL	Anti-collision light
ADC	Air data computer
ADELT	Automatic deployable Emergency Locator Transmitter
ADF	Automatic direction finder
AEO	All engines operating
AFCS	Automatic Flight Control System
AGL	Above ground level
AHRS	Attitude Heading Reference System
ALT	Altitude or Altitude hold
ALT.A	Altitude acquire
AMC	Aircraft Management Computer
APCP	Autopilot control panel
A.TRIM	Automatic trim system
ATT	Attitude or Long term attitude hold
BAT	Battery
BKUP	Backup SAS
BOT	Bottle
CRHT, CR.HT	Cruise height
DA	Decision Altitude
DEG, DEGR	Degraded
DG	Directional gyro
DH	Decision height
DISCH	Discharge
DISCON	Disconnected
DMAP	Digital Map System
DME	Distance measuring equipment
DSAS	Digital SAS
DST	Distance
DTD	Data Transfer Device
DTK	Desired Track
EFB	Electronic Flight Bag
ELT	Emergency Locator Transmitter
EMER	Emergency
EMS	Emergency Medical Services
EPU	External power unit
FADEC	Full Authority Digital Engine Control
FDS	Flight Display System
FLI	First limit indicator
FMS	Flight management system
FND	Flight and Navigation Display
FPA	Flight Path Angle
GA	Go Around
GEN	Generator
GPS	Global positioning system
GS	Ground speed
GTC	Ground trajectory control
GTC.H	Ground trajectory control with hover mode
GTN	GARMIN GTN 750
HAT	Height Above Terrain
HDG	Heading
HEMS	Helicopter Emergency Medical Services
HIGE	Hover in ground effect
HISL	High Intensity Search Light
HMD	Helmet Mounted Display
HOGE	Hover out of ground effect
HTAWS	Helicopter Terrain Awareness and Warning System
IAS	Indicated airspeed
IBF	Inlet Barrier Filter
IESI	Integrated Electronic Standby Instrument/Indicator
IMA	Integrated Modular Avionics
LAVCS	Light Helicopter Active Vibration Control System
LDG	Landing (Landing Light)
LNAV	Lateral Navigation approach (nonprecision)
LNAV+V	Non-precision LNAV approach with vertical guidance
LNAV/VNAV	Lateral Navigation and Vertical Navigation approach
LOC	Localizer
LOW ALT	Low altitude
LP	Localizer Performance without vertical guidance

LP+V	Localizer Performance with advisory vertical guidance
LPV	Localizer Performance with vertical guidance
L/VNAV	Lateral Navigation and Vertical Navigation approach
LSK	Line select key
MFD	Multifunction display
MGB	Main gearbox
MISC	Miscellaneous
MSG	Message
MSTR	Master
MTOW	Maximum Takeoff weight
N1	Gas generator speed
N2	Power turbine speed
NAVD	Navigation display
OAT	Outside air temperature
OBS	Omni Bearing Selector
OEI	One engine inoperative
OGE	Out of ground effect
OVHT	Overheat
PAX	Passenger
pb	Push Button
QTY	Quantity
RA	Radar altitude
RNAV	Area Navigation
SAS	Stability augmentation system
SBAS	Satellite Based Augmentation System
SEMA	Smart electro-mechanical actuator
SL, S/L	Search Light
SK	Select Key or Soft Key
STBY	Standby
SUSP	Suspended
SVS	Synthetic Vision System
SYS, SYST	System
TAS	True airspeed
TGB	Tail gearbox
TOP	Takeoff power
TOT	Turbine outlet temperature
TRQ	Torque
TRK	Track
V.APP	Vertical approach
VENT	Ventilation
VMS	Vehicle Management System
VNE	Never-exceed speed
VNE power off	Maximum speed in autorotation
VOR	VHF omnidirectional radio ranging
VRS	Vortex Ring State
VS	Vertical speed
VTSS	Takeoff safety speed
VY	Best rate-of-climb speed
XFER	Fuel transfer pump

MSFS/H145 Default-Function

MSFS-Function	H145 – System	H145 – Function
TOGGLE YAW DAMPER	H145M Weapons	Fire (Primary)
YAW DAMPER ON	H145M Weapons	Fire (Secondary)

Changelog

The changelog is constantly updated with the H145 version history on <https://davux.com/docs/h145/>

Preview Release: 2.1 (Build 483)

Stable Release: 2.0 (Build 406)

V 2.1 April 2024

06.04.24 Add "Recommended MSFS Settings", "MSFS Cockpit Interaction System" and "H145 in Multiplayer" from the old PDF-User Guide

03.04.24 Add Default Function-Table

V 2.0 March 2024

18.03.24 Added Missions (Cargo and HEMS) from Mission-Website

17.03.24 Added Mission (Firefighting) from Mission Website;
Added Pedal-Settings for Xbox controller (page 11; Source: pinned msg)
